Computational Thinking

Objectives

- Define computational thinking and its component skills (i.e., decomposition, pattern recognition, abstraction, algorithm design).
- Apply computational thinking to solve a problem.
What is Computational Thinking

- "Computational thinking refers to the thought processes involved in expressing solutions as computational steps or algorithms that can be carried out by a computer" (Cuny, Snyder, & Wing, 2010; Aho, 2011; Lee, 2016).

- "Understanding and solving problems in ways that leverage the power of technological methods to develop and test solutions." (ISTE International Standards)

Component Skills of CT

- **Decomposition**: Breaking down data, processes, or problems into smaller, manageable parts
- **Pattern Recognition**: Observing patterns, trends, and regularities in data
- **Abstraction**: Identifying the general principles that generate these patterns
- **Algorithm Design**: Developing the step by step instructions for solving this and similar problems
- **Evaluation**: Determining if your solution is a good one.
Practice Instructions

Your paper presents a scenario & questions intended to guide you through a CT process.

1. Divide into 5 Groups
2. Read through the scenario aloud and, as a group, answer the questions that guide you through the CT process.
3. You have approximately 10 minutes.
