Analysis of Sugar Beet Pulp by X-ray Photoelectron Spectroscopy

Guilin Jiang, Ghaleb A. Hussein^{a)}, Larry L. Baxter, and Matthew R. Linford
Brigham Young University, Provo, Utah 84604

(Received 12 August 2004; accepted 16 November 2005; published 30 December 2005)

Determining the chemical structure and composition of biomass fuels using x-ray photoelectron spectroscopy (XPS) can provide fundamental knowledge of their structures that is useful in understanding and predicting their combustion behavior. Sugar beet pulp is an example of an agricultural residue (byproduct of food and feed production) of potential interest for biomass combustion. The XPS spectra of sugar beet pulp provide both its elemental composition and indications of its bonding. Traditional fuel analyses of this fuel are also provided. These include: ultimate analysis — the elemental composition of the overall fuel (C, H, N, S, and O); chlorine analysis — reported here as part of the ultimate analysis but formally a separate procedure; proximate analysis — the proximate composition of the fuel (moisture, fixed carbon, volatiles, and ash); heating value — the specific heat of combustion. These data are summarized with the XPS spectra. © 2005 American Vacuum Society. [DOI: 10.1116/11.20040803]

SPECIMEN DESCRIPTION

Host Material: sugar beet pulp

Host Material Characteristics: homogeneous; amorphous; unknown electrical characteristics; biological material; powder

Chemical Name: cellulose

Host Composition: see entry for History & Significance

Form: powder

History & Significance: Sugar beet pulp is an example of an agricultural residue (byproduct of food and feed production) of potential interest for biomass combustion. The XPS spectra of sugar beet pulp provide both its elemental composition and indications of its bonding. Traditional fuel analyses of this fuel are also provided. These include: ultimate analysis — the elemental composition of the overall fuel (C, H, N, S, and O); chlorine analysis — reported here as part of the ultimate analysis but formally a separate procedure; proximate analysis — the proximate composition of the fuel (moisture, fixed carbon, volatiles, and ash); heating value — the specific heat of combustion. These data are summarized with the XPS spectra. The chemical composition of sugar beet pulp is summarized in Table 1.

As Received Condition: powder

Analyzed Region: same as host material

Ex Situ Preparation/Mounting: Sawdust powders were used as received. The powders were pressed onto a piece of nonconductive double-sticky tape mounted on a piece of silicon, which was then mounted on the sample stage with a piece of the same tape.

In Situ Preparation: none

Pre-Analysis Beam Exposure: No damage was observed in the sample even after several hours of exposure to x-ray radiation.

Accession # 00897

Technique: XPS

Host Material: sugar beet pulp

Instrument: Surface Science
Instruments SSX-100

Major Elements in Spectrum: C, O

Minor Elements in Spectrum: N

Printed Spectra: 7

Spectra in Electronic Record: 7

Spectral Category: technical

After 4 h of exposure to x rays, the intensity of the N 1s scan did not change.

Charge Control: A flood gun was applied. The flood gun voltage was 4 V, and its current was less than 50 mA. A metal screen was used to mask the sample. The charge control was determined by observing zirconia Zr 3p_{3/2} peak positions under different flood gun settings. XPS spectra showed a Zr 3d_{5/2} at 182.3 eV. The metal screen used was nickel, 1 mm distance, 70 lines/in. and 90% transmission.

Temp. During Analysis: 298 K

Pressure During Analysis: <2.0×10⁻⁶ Pa

INSTRUMENT DESCRIPTION

Manufacturer and Model: Surface Science Instruments SSX-100

Analyzer Type: spherical sector

Detector: resistive anode position detector

Number of Detector Elements: 128

Table 1: Fuel analysis of bio-fuel sunflower shells (ash free basis except for ash and LHV, which are on an as-received basis).

	% by weight
Moisture	9.84
C	46.40
H	5.85
O	34.33
N	0.88
S	0.18
Ash	2.52

LHV*, MJ/kg	18.816

*Lower heating value

INSTRUMENT PARAMETERS COMMON TO ALL SPECTRA

■ *Spectrometer*

Analyzer Mode: constant pass energy

Throughput ($T=E^N$): $N=0$

Excitation Source Window: 12 μm aluminum foil

Excitation Source: Al K_α monochromatic

Source Energy: 1486.6 eV

Source Strength: 200 W

Signal Mode: multichannel direct

■ *Geometry*

Incident Angle: 55°

Source to Analyzer Angle: 70.8°

Emission Angle: 55°

Specimen Azimuthal Angle: 0°

Acceptance Angle from Analyzer Axis: 0°

DATA ANALYSIS METHOD

Peak Shape and Background Method: Shirley background function

Quantitation Method: Sensitivity factors were obtained from ESCA 2000 NT software supplied by Service Physics. The peak areas are the areas above a linear background.

ACKNOWLEDGMENTS

The authors acknowledge U.S. DOE Biomass Power Program for financial support, and Elsam engineering and Eltra, both Danish companies, which provided complementary analyses and some financial support for this investigation.
