Lonely Planet

There are animals from every continent and ocean. In North America, monarch butterflies migrate from Canada and the US to Mexico. The bee hummingbird lives in what little remains of the Cuba tropical forest. In Asia, the Baikal seal can be found in Lake Baikal, where two-thirds of the plants and animals are unique to the lake. In Australia, kiwis roam among the kauri trees, and saltwater crocodiles live in the brackish rivers leading to the Indian Ocean. Deep in the Mid-Atlantic Ridge, find mysterious animals like Murray's abyssal anglerfish, and in the seagrass meadows of the Indian Ocean, leafy sea dragons hide.

This animal atlas is rich with educational information, including facts on animals, the environments they live in, and scientists who have studied them. Several of this book's pages fold out into much bigger pages, and most pages have flaps that, when lifted, reveal more facts or pictures. Most of the book is illustrated with detailed drawings of plants and animals; however, there are some photographs included as well. Some of these illustrations even depict animals at life-size. Illustrated maps also show where the animals are from and what type of biome is there. This book is suitable for children ages 9 to 12, but the fun illustrations and flaps may spark the interest of even younger children, with supervision as needed to help them understand how to care for the interactive flaps and pages.
