

SUPPLEMENTARY MATERIAL 3. A haplotype statistical parsimony network (Joly et al. 2007) for those haplotypes identified as Physa1 to Physa7 (here 1–7). Ellipse size is proportional to the total number of samples with the identified haplotype. Red ellipses enclose groups that occurred at springs containing multiple haplotypes. Physa7 (7) was additionally found at Red Spring and Willow Spring (BLM). With the exception of haplotype Physa7, all *Physa* haplotypes were located in a single spring. See Table 1 for spring coordinates in Nevada.
