

SUPPLEMENTARY MATERIAL 3. Map of modeled *Helminthoglypta greggi* rock feature habitat on Soledad Mountain, Middle Butte, and Standard Hill based on surveys by WestLand (2017). The modeled habitat does not include additional acreage where *H. greggi* snails and shells have been documented—i.e., among waste rock from historic mining operations that have been recolonized by snails, among rocks on level ground, and in the soil layer beneath shrubs.
