The Annual Mary Lou Fulton Mentored Research Conference showcases some of the best student research from the College of Family, Home, and Social Sciences. The mentored learning program encourages undergraduate students to participate in hands-on and practical research under the direction of a faculty member. Students create these posters as an aide in presenting the results of their research to the public, faculty, and their peers.

Does Attachment to Parents Mediate the Negative Relationship Between Parental Conflict and Children’s Self-Regulation?

Lisa Tensmeyer Hansen, B.S. * James M. Harper, Ph.D. * Jeremy Yorgason, Ph.D.

This longitudinal study considers the effect of parent-child attachment on the self-regulation of children. Four hundred and forty-eight families from the Northwestern U.S. were surveyed as part of Brigham Young University’s Flourishing Families Project. Each family studied included a child between the ages of 11 and 13. Couple conflict and the child’s attachment to parents were assessed at time 1 and the child’s self-regulation was assessed each year thereafter for three years.

RESULTS
Higher couple conflict predicted lower attachment to father and to mother at time 1 with a greater negative effect for fathers.

<table>
<thead>
<tr>
<th>Attachment to</th>
<th>Change Estimate</th>
<th>S. E.</th>
<th>Two-tailed P-value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Father</td>
<td>-0.351</td>
<td>0.055</td>
<td>&lt;.001</td>
</tr>
<tr>
<td>Mother</td>
<td>-0.256</td>
<td>0.059</td>
<td>&lt;.001</td>
</tr>
</tbody>
</table>

Higher scores on attachment to father predicted greater initial levels of child self-regulation (at time 2) but not slopes of child self-regulation (Table 2).

<td>0.107</td>
<td>N Sig.</td>
</tr>
</tbody>
</table>

Model results suggest that father attachment mediates the link between couple conflict and initial levels of self-regulation. Bootstrapping was used to obtain corrected standard errors, which indicated the significant indirect effect of couple conflict (with father attachment) on self-regulation. Sobel’s test confirmed the mediation at -3.967 p < .001.

This model accounted for 40% of the variation in child self-regulation measured at one year.

CONCLUSION
Attachment to father may be an important mechanism in the relationship between couple conflict and child self-regulation. Further research should examine whether father attachment also moderates this relationship.
