With one foot on the Tigris and the other on the Anatolian plateau, Assyrian merchants conducted a brisk trade in tin, textiles, and silver in the late twentieth and early nineteenth centuries BCE.\(^1\) The structural aspects of the shipment and sale of tin and textiles in exchange for silver in caravan cycles have been the subjects of many excellent studies with methodologies including lexical studies and text-type studies.\(^2\) In addition, archival studies have been helpful in giving a sense of the variety of organization and involvement in the trade among different individuals.\(^3\) However, approaches that focus on structural activities like transporting, or on archives spanning a generation of activity, inevitably sublimate the context of merchants’ short-term interests—interests that drove the creation and retention of the surviving documents. This is particularly so with the richest group of documents from the Old Assyrian trade, namely, the business letters sent between coordinating merchants scattered throughout the locales of the trade. Like most cuneiform missives, the Old Assyrian letters were not explicitly dated and few contain references that permit them to be secured confidently in the chronology of a merchant’s life or in relation to other letters. As a result, many letters must often be read for structural patterns of the trade or as anecdotes, connecting most directly to recognizable contours of the human condition. Some correspondence can be recognized as pieces of a particular epistolary conversation. Such conversations are most easily recognized when the circumstances are

\(^1\) This article represents a revised section of my dissertation and of a paper read at the 220th Meeting of the American Oriental Society Conference, (St. Louis, Missouri), 12 March 2010. I would like to thank Mogens Trolle Larsen, Martha Roth, Seth Richardson, Gojko Barjamovic, and Thomas Hertel for their comments and criticism during the preparation of those earlier works. I also thank my reviewers for their helpful suggestions. Of course, I bear responsibility for any errors that persist. Abbreviations are cited according to the Chicago Assyrian Dictionary except for: Adana = tablets in the collection of Adana Archaeological Muesum; AKT = Ankara Kültepe Tabletleri; KEL = Kültepe Eponym List; kt a/k, kt b/k … kt 94/k = tablets from the excavations at Kültepe; LAPO = Littératures du Proche-Orient ancien; OAA/S = Old Assyrian Archives/Studies; OBO = Orbis Biblicus et Orientalis; PIHANS = Publications de l’Institut historique-archéologique néerlandais de Stamboul; POAT = Pennsylvania Old Assyrian Texts; TC = Tablettes cappadociennes (TCL 4 = TC 1; TCL 14 = TC 2; TCL 19–21 = TC 3); TPAK = Tablettes paléo-assyriennes de Kültepe; TTC = Trente tablettes cappadociennes; VS = Vorderasiatische Schriftdenkmäler; WAG = tablets in the collection of the Walters Art Gallery in Baltimore.

most unusual, for example, when letters discuss an ongoing legal dispute. When such an epistolary conversation is recognized, an opportunity arises to read the documents in a way that, at least in part, escapes the limitations of an anecdotal frame.

The present study arises from the rare opportunity to reconstruct a single iteration of a mundane caravan cycle through eight documents from the archive of Pūšu-kēn revolving around the business interests of Šalim-āhum, a wealthy merchant based in Aššur. These eight documents, mostly letters, form an epistolary conversation between Šalim-āhum and his representatives,5 including Pūšu-kēn. The principle thread of the conversation is the progress of a caravan cycle composed of goods owned by Šalim-āhum. Previous reviews of Šalim-āhum’s family firm describe the roles taken by his sons in his trade operations,6 however, this study focuses on one particular caravan cycle, not claiming to represent the entirety of Šalim-āhum’s activities, nor his only mode of engaging in the trade. Contextualized within the frame of the reconstructed caravan cycle, Šalim-āhum’s correspondence with his representatives can be read with an eye to the interests of the original correspondents. Among the mundane details of accounting and reporting, a social topography of the caravan cycle emerges that highlights the extent to which Šalim-āhum could interact with a wide range of merchants in the trade.

To chart the social topography of Šalim-āhum’s caravan cycle, the body of this article is divided into three sections. In the first section, I present the eight documents in transliteration and translation and then provide a brief reconstruction of the caravan cycle and its development. In the second section, I address Šalim-āhum’s occasional lack of precision, which suggests, against conventional wisdom, that Assyrian merchants were not always accurate in their communication, bringing some nuance to expectations of accuracy when pursuing reconstructions. In a third section, I explore the social topography of the caravan cycle by evaluating Šalim-āhum’s construction of his relationships with his transporters, his buyers, and his representatives, as implied in his communication. Few persons involved in the caravan cycle had demonstrably durable relationships with Šalim-āhum, and aside from his son Dān-Aššur, who played a minor role, all other persons maintained separate balance sheets from Šalim-āhum. Moreover, Šalim-āhum’s interaction with the different groups suggests that displacing risk onto other persons was an important operation for Šalim-āhum. It appears that, at least during this caravan cycle, Šalim-āhum acted as an independent wholesale merchant, sending large shipments of goods to Kaneš to sell them on credit for silver.

**Brief Reconstruction of Šalim-āhum’s Caravan Cycle**

Šalim-āhum’s epistolary conversation can be arranged in chronological order by reconstructing the single caravan cycle that occupies so much of its content. The caravan cycle can be seen as developing through three phases recorded in eight surviving documents.

---

4. Most often, merchants make reference to a basic commercial representative or representatives who would transact business on their behalf (īa kīma). Old Assyrian merchants also had representatives for more formal legal spheres (iazzuztum). On occasion, an attempt is made to differentiate these two types of agents in translations. During this particular caravan cycle, none of the agents/representatives that Šalim-āhum used acted the role of a iazzuztum, therefore I assume that they were functioning only as īa kīma representatives during this period.

5. Sharing a name with a former Assyrian ruler, Šalim-āhum’s wealth suggests he may have been related to the royal family. Šalim-āhum’s activities are manifest largely both through the documents of Pūšu-kēn’s archive (excavated by locals before ca. 1920 and by Hrozny in 1925) and through an archive associated with his sons (texts excavated in 1970 and published partially in AKT 3). The structure of Šalim-āhum’s family firm received treatment in both J. G. Dercksen’s single review of AKT 1, 2, and 3 in JESHO 41 (1998), 220–24, and C. Michel, Correspondance des Marchands de Kanisî, LAPO 19 (Paris: CERF, 2001), 403–18. Pūšu-kēn’s dossier of correspondence with Šalim-āhum is the largest in his archive. Because his archive was studied early on (P. van der Meer, Une correspondance commerciale assyrienne de Cappadoce [Rome: Imprimerie Pie X, 1931]), he is one of the most recognizable merchants from the Old Assyrian trade. Like Šalim-āhum, Pūšu-kēn seems to have been well connected to the highest echelons of Old Assyrian society, handling business for the Assyrian king on occasion (POAT 18; KTS 1 30). Pūšu-kēn wielded power prominently in certain sessions of assemblies in Kaneš (AKT 6a 111). For a discussion of Pūšu-kēn’s family, see G. Kryszat, Zur Chronologie der Kaufmannsarchive aus der Schicht 2 des Kārum Kaneš, OAAS 2/PIHANS 99 (Leiden: Nederlands Instituut voor het Nabije Oosten, 2004), 40–50.
In the first phase, Šalim-aḫum initiated the caravan cycle by shipping goods to Anatolia from his location in Aššur. Šalim-aḫum produced multiple bills of lading for the several bundles of cargo he entrusted to his various contracted drivers, including Nūr-Ištar’s bill, which survives (1-CCT 2 4b/5a). In the second phase, when the drivers arrived in Kaneš, Šalim-aḫum’s representatives accepted his goods, paid import duties, settled accounts with the drivers, and sold some of the goods on credit to buyers. The representatives composed a number of documents, including a caravan account sent to Šalim-aḫum explaining when the silver from different sales would come due. Pūšu-kēn’s archival copy of the letter, which he kept in Kaneš, survives (2-Prag I 426). The representatives were not able to sell all the goods immediately, and when they later sold the remainder, they reported it to Šalim-aḫum, and Šalim-aḫum acknowledged receipt of the news. This can be read in a letter from later in the caravan cycle (6-TC 3 23).

In the third phase, beginning after the first portion of goods was sold on credit, Šalim-aḫum attentively tracked the collection of the silver due to him and pestered his representatives to send his silver. Even before receiving the caravan account, Šalim-aḫum was urging his representatives to sell his goods and included reminders to collect and send funds pertinent to other concurrent business (3-POAT 19). Soon after receiving the caravan account (2-Prag I 426), Šalim-aḫum wrote to remind the representatives to collect the first maturing claim on silver (4-TC 1 14). Thereafter, Šalim-aḫum’s representatives collected most of the silver he had requested and sent the funds to Aššur, recording their actions in a memo (5-VS 26 130). Šalim-aḫum acknowledged receiving those funds with a letter outlining the running balance his representatives owed him (6-TC 3 23). The representatives continued to collect claims as they came due and again sent another shipment of silver to Šalim-aḫum; their copy of the letter sent with the silver survives (7-CCT 5 50b). When he received the silver, Šalim-aḫum again took stock of the running balance between him and his representatives and reminded them to collect the remaining claims maturing in the near future (8-BIN 4 26). At this point, the stream of documentation breaks off. Whether or not Šalim-aḫum received the remainder of his outstanding claims is unknown.

Not all of the eight documents are letters in the strictest sense. Though styled as a letter, the bill of lading (1-CCT 2 4b/5a) had a legal function. Likewise, the record Pūšu-kēn and the representatives kept for themselves (5-VS 26 130) was not created as part of a missive. However, both documents can be considered evidence of the epistolary conversation conducted by Šalim-aḫum and his representatives, and are included here as pieces of that exchange. Translation and transliteration of the texts with brief notes pertinent to the reconstruction precede a discussion of the caravan cycle as far as it can be followed.

1-3Šalim-aḫum to Lā-qēpum and Pūšu-kēn: 4-926 very fine kutānum textiles under my seal a black donkey, and 5 minas of tin for his disposal—Nūr-Ištar transports all this to you (pl.). 60The wages of the donkey driver are

---

6. To facilitate keeping track of the different documents from the caravan cycle, I will refer to each document by its order in the reconstructed sequence in bold (1 through 8), followed by its publication designation and, where appropriate, line number, for example: (1-CCT 2 4b/5a 1-12).
satisfied. Do not make (the merchandise) too expensive (for) a one or two month (credit purchase). Combine the donkey with the textiles (for sale). In addition to the tin at his disposal, i.e., at the disposal of Idūštār’s son, I gave him copper worth 5 minas of tin for Amurrum, and he himself put it in his caravan. Let your full report come concerning the silver (paid) for my textiles, how much you placed on the merchant, and the terms.

18–23: The interpretation of Nūr-Ištār’s role in this sentence is difficult and the translation here is admittedly awkward. There lies two possibilities for Idūštār’s son: 1) He added some additional tin in addition to the tin at Nūr-Ištār’s disposal, and separate from the copper mentioned afterward. In this case a conjunction would be appreciated, but its absence is not determinative. 2) He is the same person as Nūr-Ištār because the ša clause is an appositional description of the tin at his disposal. I propose reading the document with the understanding that Nūr-Ištār is the son of Idūštār (l. 19). That is, the bill of lading is entirely concerned with Nūr-Ištār’s cargo, written when the cargo was packed and sealed just before the caravan departed. I favor this interpretation because the bill of lading traveled with the caravan and therefore more slowly than other communications; it would be a poor ten when the cargo was packed and sealed just before the caravan departed. In this case a conjunction would be awkward.

Your merchant must be reliable.

1-3To Śalim-aḫum, from Lā-qēpum, Ili-āhum, and Pūšu-kēn. 1-4After we deducted the excise duty and deficiencies, they (the palace) cleared your 122 minas 8 shekels tin. 3-27 kutānum textiles, 4 wrapping textiles (and your tin)—all thisErra-iddī’s son entrusted to us. 5-10We have not yet settled accounts with him. 11Your donkeys died. 11-10Thereof, we bundled 20 kutānum textiles at ½ mina each, 4 šūrum textiles at 15 shekels each, a 7 shekel rate for your tin, and (this lot) is placed on a merchant on long terms for 28 minas 27 shekels of silver. 16-17The remainder of your kutānum textiles—7 textiles—are deposited to your account. 18-202 talents 10 minas of tin, 4 wrapping textiles, 5 kutānum textiles, 1 black donkey are from the charge of Aššur-muttabbil. 21-26Nūr-īštar drove here 26 kutānum textiles and 1 black donkey. 27One donkey died. 28-29Thereof, the excise duty was ½ textiles, and we balanced 1 shekel silver. 24-23 textiles for purchases. 251 textile is with Ilabrat-bānī. 28They cleared the remainder of your textiles—26 textiles. 27-28From the 2 talents 10 minas of tin of the charge of Aššur-muttabbil, the excise duty was 4 minas. 29-34 minas 54 shekels (of tin) were deficient. 30-31After the “hand tin” was spent, we balanced 7 minas 27 shekels of tin to Aššur-muttabbil. 30-34They cleared the remainder of your tin: 1 talent 53 minas 39 shekels. 34-37We took 11 minas of tin from the caravan of Aššur-mālik at the palace office and placed it in your tin. 34-41In sum, (the lot was) 2 talents 4 minas 39 shekels of your tin at a rate of 7 shekels, 26 kutānum textiles at a ½ mina each, a donkey for ½ mina. 41-44The total silver for the tin, textiles, and the donkey: 31 minas 18 ½ shekels, is placed on a merchant on long terms, 44-45 textiles for wrapping are deposited to your account. 45-46From the 6 talents 30 minas of tin of the charge of Aḥ-šalim, the excise duty was 21 minas. 463 minas 10 shekels (of tin) were missing. 47The remainder of your tin was 6 talents 5 minas 50 shekels. 50-50Thereof, 5 talents 4 minas 40 shekels (of tin) at a rate of 8 shekels, 50 kutānum textiles, together with šūrum textiles, which they seized at 20 shekels each, are placed on the merchant on short terms for 54 minas 45 shekels of silver.

8: DUMU E-ra-di. The original edition and Hecker’s translation of the text suggest that DUMU E-ra-di is Aššur-muttabbil son of E-ra-di (as found in Prag I 633:21) and the same Aššur-muttabbil as mentioned in l. 20 of this document. However, Prag I 633 is entirely unrelated to this matter. And DUMU E-ra-di and Aššur-muttabbil can be safely distinguished within the document: the two transported different cargoes, and while the representatives had not yet balanced DUMU E-ra-di by the time of composition (ll. 7–10), they had already balanced Aššur-muttabbil (ll. 30–32).

3-POAT 19 (L 29–574)

\(^{15}\) Translation and study: van der Meer, Correspondence, no. 25.
15 shekels, 30 shekels was its transport tariff; 21–25Erraya’s son brought me 20 minas 50 shekels, 20 shekels was its transport tariff; 24–27Dān-Āššur brought me 31 minas 15 shekels, 30 shekels was its transport tariff. An additional 2 minas is the equivalent to his textiles. 26–29Illi-ālūm brought me 41 minas 40 shekels, 40 shekels was its transport tariff. 29–30Kurban-Iṣtar brought me 18 minas 18 shekels. 31–33Total: 147 minas 18 shekels of silver that they brought. 32–34The remainder of silver is 30 minas 23 shekels of those (debts) whose terms are past due. 35Don’t listen to the interest. 36–37Have the silver paid and brought to me in the first (transport), 37–42and then write to Ḫinnaya so that he has the silver brought to me, which they extended on credit there. 40–44In your tablet 12 minas 35½ shekels of silver of the cargo of Aḥ-šālim were given to merchants on long-term credit. 45–46Have them pay 31 minas 18½ shekels of silver of the cargo of Aššūr-muttatūm and Nūr-Iṣtar if their terms are due, and have (it) brought to me in the first (transport). 48–51As for the silver which Illi-ālūm and Kurban-Iṣtar brought to me, why is it that the tablet has become too difficult for you to send to me?

41: 121. Collated; see 6-TC 3 23:6. Some other goods must have been sold along with the tin. If the 61 minas 10 shekels of tin from Aḥ-šālim’s cargo sold at an 8-shekel rate the yield would have been 7 minas 38.7 shekels of silver; if it sold at a 7-shekel rate the yield would have been 8 minas 44.3 shekels of silver.
45: 18½ ǦIN. Collated by the author.
48–51: The intent of this comment is uncertain. Perhaps Šālim-ālūm expected more documentation with the shipment? If the comment was a sarcastic jab, then Šālim-ālūm must have been alluding to not having received a tablet in conjunction with the silver sent with the two transporters mentioned. This merely serves to underline Šālim-ālūm’s expectation of documentation at every stage of the process.

Phase One: Shipping Off the Goods

Šālim-ālūm began this caravan cycle by purchasing almost 11 talents of tin, roughly sixty textiles, and seven donkeys with their tack in Aššūr. He contracted with five transporters, or drivers,16 to take the goods: Nūr-Iṣtar, Aššūr-muttatūm, Aḥ-šālim, and Amurrum-bānī, and a man Šālim-ālūm referred to as Erra-idi’s son. Nūr-Iṣtar’s bill of lading (1-CCT 4b/5a) survives as the only document from this phase. These five men drove seven of Šālim-ālūm’s donkeys and the goods he had purchased from Aššūr to Kanaṣ. Nūr-Iṣtar’s bill of lading recorded Nūr-Iṣtar taking one donkey load of textiles. The caravan account (2-Prag I 426) confirms that the shipments of tin were sent according to standard practice: two burdens (ṣuqlum) of tin slabs totalling 65 minas each were wrapped in šūrum textiles and packed on either side of a packsaddle, and sealed for the duration of the trip.17 Nūr-Iṣtar was given 5 minas of tin and additionally some copper for him and his one donkey (1-CCT 4b/5a: 6–7). The “hand tin” (anniḳ qaṭīm) was used to pay expenses at inns and caravanserais, tolls through cities, and across bridges and ferries, to purchase fodder for the donkeys and feed for himself, sometimes to hire guides or armed escorts, and likely to

16. One of transporters in this caravan cycle, Nūr-Iṣtar, was referred to as a sāridum, often translated “packer.” Another term used much less often was rāḏûm (rāḏi qaṭīm, BIN 4 1:19, see also K. R. Veenhof, Aspects, 252), though Nūr-Iṣtar’s activity in this instance was described with the verb rāḏûm by the representatives (2-Prag I 426:22). The rāḏûm seems to be associated more often with armed escorts or as guides. In addition to these two terms, kassārum designated another transporter, translated “pack master,” or “caravan leader.” See J. G. Dercks, Old Assyrian Institutions, PPHANS 98 (Leiden: Nederlands Instituut voor het Nabije Oosten, 2004), 283, and G. Barjamovic, Historical Geography of Anatolia in the Old Assyrian Colony Period, CNI Publications 38 (Copenhagen: Carsten Niebuhr Institute of Ancient Near Eastern Studies, 2011), 15.
17. For the further breakdown of the tin load into “half-packs” (mutatūm), each containing a šuqlum bundle, in turn composed of two packets containing three slabs of tin, each approximately weighing 10½ minas, wrapped in a šūrum textile, see Veenhof and Eidem, Mesopotamia: The Old Assyrian Period, 82.
pay bribes. Donkeys took anywhere from two dozen to thirty textiles. Many donkeys laden with tin carried a few textiles on top without severe distress.

**Phase Two: Receiving and Selling the Goods**

The moment of the arrival in Kaneš is documented by the long and detailed caravan account drawn up by Lâ-qēpum, Pûšu-kēn, and Ili-âlûm. The copy Pûšu-kēn kept in Kaneš survives (2-Prag I 426). Before selling the goods on credit, the representatives cleared the goods through customs by paying various import duties and settling expenses with the drivers. Šālim-âlûm’s representatives first oversaw the paying of import duties and tithes to the palace: an excise duty on tin (nishātām—4 minas of tin per 130 minas of tin [a donkey load]), and both a tithe (ištātum—one textile in ten), and an excise duty on the textiles (nishātum—one textile in twenty). After the goods were cleared, Šālim-âlûm’s representatives settled accounts (nikkassā šāsām) with Šālim-âlûm’s drivers, repaying (apālum) expenses paid in excess of the “hand tin” where necessary. The representatives separated the report on clearing the goods, balancing with the transporters, and selling the goods according to the transporters and their cargo in the following order: 1) son of Erra-idi, 2) Nûr-Iṣtar and Aššur-muttabbîl, and 3) Aḫ-šalîm.

The representatives reported first on Erra-idi’s son and his pair of donkeys, though they did not report exact duties paid and had not yet settled accounts with him. However, the report on Erra-idi’s son exemplifies how the caravan account provides a good understanding of the cargoes that left Aššur. The cargo of Erra-idi’s son lacked 3 minas 52 shekels (mutāṭû, usually translated as “deficiencies”), revealing that while his cargo had been nominally listed as 130 minas for purposes of accounting on the road and at customs in Kaneš, in fact he left Aššur with 126 minas 8 shekels tin. He turned over twenty-seven textiles after customs, but because the representatives did not report duties paid on the textiles, the total number of textiles brought by Erra-idi’s son cannot be traced. The donkey carrying textiles could have brought between twenty-four or thirty textiles; the other donkey loaded with tin may have carried some textiles in a top-pack.21

Next, the representatives discussed clearance and sale of the goods brought by Aššur-muttabbîl and Nûr-Iṣtar, which passed through customs as a unit (Il. 18–45). The representatives accounted precisely for the cleared tin in Aššur-muttabbîl’s cargo.22 Aššur-muttabbîl had exceeded his allotted “hand tin” by 7 minas 27 shekels of tin and

---

18. Because silver was much cheaper in Anatolia, taking silver to Anatolia was wasteful. The copies of treaties between large cities, including Apum, Ḥaḫḫum, and Kaneš, as well as one with a small, unknown town, show that palaces and caravanserais along the routes willingly accepted tin instead of silver from those travelling towards Kaneš. Silver-rich merchants travelling back from Anatolia would be assessed in silver. For a treatment of the treaties, see Veenhof and Eedem, *Mesopotamia: The Old Assyrian Period*, 183–218. For a list of expenses involved in transporting, see Veenhof, *Aspects*, 44–53; Barjamovic, *Historical Geography*, 34–51.
20. These assessments are normally translated as taxes, e.g., Veenhof and Eedem, *Mesopotamia: The Old Assyrian Period*, 82–83. I find useful the distinction between taxes, which were assessed on the members of a community, and duties, which were assessed on outsiders. This is not a distinction that is clearly made by the vocabulary of the merchants. Merchants paid nishātum as tax when departing from the city of Aššur, then paid nishātum as duty when arriving in Kaneš. Expenses such as īštātum were also used to refer to both tolls on the road and to monies paid into the merchant community itself. In Kaneš the palace assessed nishātum and īštātum duties.
21. The agents state that Erra-idi’s son turned twenty-seven textiles over to them after the clearing process. Because twenty of these textiles were sold and the other seven textiles were deposited in Šālim-âlûm’s account, the original amount before duties and taxes must have been greater. If Erra-idi’s son brought twenty-eight textiles, the excise tax would have been 1 2/5 textiles. In that case, the palace would have likely taken two textiles and then have been responsible to refund 12 shekels of silver. If there had been twenty-nine textiles, the palace could have taken two textiles and repaid 11 shekels back to Šālim-âlûm’s agents. However, if the palace also purchased the tithe on the textiles then there would have to have been at least thirty-two textiles for Erra-idi’s son to have turned over twenty-seven textiles to Šālim-âlûm’s agents after passing through customs. (Thirty-two textiles would have yielded 1 3/5 excise and three textiles as tithe; the palace could have taken five textiles and repaid 8 shekels of silver to the agents.)
22. The excise duty on the 130 minas of tin was 4 minas of tin, and there was 4 minas 54 shekels of tin deficient.
was remunerated by Šalim-قاعدة’s representatives (2–Prag I 426:30–32). Aššūr-muttabbil also brought 5 Kutānum textiles atop the tin on his donkey. Those textiles in Aššūr-muttabbil’s top-pack paid for the tithe and excise duty on Nūr-Iṣtar’s textiles, allowing Nūr-Iṣtar’s 26 “extremely fine” Kutānum textiles to clear en bloc. While there is a half textile unaccounted for in the details of paying the nishšatum and the isrātum and a textile taken by an llabrat-bāni, it seems likely that Šalim-قاعدة’s strategy was to maximize clearing the “extremely fine” textiles by paying the duties with the other textiles.

Finally, the representatives reported on the three donkeys loaded with tin brought by Aḫ-šalim (2–Prag I 426:45–55). Though Aḫ-šalim’s cargo was nominally specified as 390 minas of tin, the actual amount was deficient by 3 minas 10 shekels, meaning 386 minas 50 shekels of tin left Aššūr. The palace took 21 minas of tin instead of the expected 12 minas for the excise duty.25 The representatives did not record their settlement with Aḫ-šalim, nor did they record the involvement of Amurrum-bāni in the caravan account, though from later records it is clear he accompanied Aḫ-šalim (5–TC 3 23:40–42). Table 1 summarizes the packaging, transportation, and customs clearance of the goods.

The representatives were to sell the tin and textiles on credit to reliable merchants, be flexible on the length of the credit term, sell the donkeys along with the merchandise, and send a full report (Tiṣritum zakkatum) when all of this was completed (1–CCT 2 4b/5a:11–17). Šalim-قاعدة’s representatives promptly sold most of the goods in three lots as soon as they cleared the merchandise through customs. Each of these three lots consisted of a combination of tin and textiles, and two largely corresponded to the contours of two separate cargoes as they passed customs. The largest, Lot 1, consisted of about 5 talents of tin from the cargo of Aḫ-šalim and fifty Kutānum textiles from an unknown source and was sold on short terms for almost a talent of silver (2–Prag I 426:50–55). Lot 2 derived directly from Erra-idī’s son’s cargo, and sold for almost half a talent of silver (2–Prag I 426:11–16). Most of the combined cargo of Aššūr-muttabbil and Nūr-Iṣtar made up Lot 3, selling for just over half a talent of silver (2–Prag I 426:41–44). Though Lots 2 and 3 were both sold on long terms, they fell due at different times as demonstrated in the letters of receipt (6–TC 3 23; 8–BIN 4 26).26 The three lots in numbered order, together with the fourth lot, sold later, are displayed in table 2.

---

23. If Aššūr-muttabbil were given “hand tin” equal to Nūr-Iṣtar’s at departure, then his average daily expense would have been about 25 shekels of tin per day—higher than average. One transporter in the trade recorded a cost of 6% shekels of tin between Aššūr and Qattara, likely a three days’ journey. Had Aššūr-muttabbil’s donkey died, it would have cost him a mina or two of tin to replace it. Or perhaps Aššūr-muttabbil hired an extra donkey to lighten the load through the mountains. Few references to the toll at the Euphrates are available, but one source suggests that the toll for one donkey was 3 or 4 shekels of tin (kt g/k 220; courtesy C. Günbratt); for further discussion, see Barjamovic, Historical Geography, 22.

24. The excise duty on the thirty-one total Kutānum textiles (Nūr-Iṣtar’s 26 + Aššūr-muttabbil’s 5) was 1% + 1/20 textiles. The representatives handed over the 1% textiles and repaid the remaining 1/20 with 1 shekel silver, suggesting that the textiles were valued at 20 shekels each. The isrātum was levied at 3 1/30 textiles and the palace actually purchased three textiles. Ilabrat-bāni took another textile. The total textiles paid out during customs thus adds up to 5% textiles, implying an extra one-half textile more than the original cargoes included. As the nishšatum and isrātum were expressed rather precisely, it is possible that Ilabrat-bāni only took half of a textile; the brief aside, 1 TUG iš-ši NIN.ŠUBUR-ba-ni (l. 25), seems the most informal of the accounting statements. Interestingly, Ilabrat-bāni’s taking of a 1/3 textile, mentioned in another series of letters, sparked a heated response from Šalim-اعدة: BIN 4 61; TC 2 3; TC 1 26; POAT 7; TC 3 20; CCT 2 3. A case can be made that the present document and those documents refer to the same point in time.

25. Though the expected duty on Aḫ-šalim’s tin cargo is 12 minas, the agents report 21 minas. The reason is unknown. This was not a scribal error for 12 because they subtracted the entire 21 from the total cargo: 390 minas – 21 minas – 3 minas 10 shekels (mutalāli) = 365 minas 50 shekels (2–Prag I 426:45–48). Perhaps each donkey carried 5 textiles in addition to the tin (though not reported), provoking the extra assemblage, but the figures don’t support such a proposition. Even if the palace had, for some unusual reason, demanded payment in tin for the duty on textiles (unknown elsewhere), the total value of both the excise and tithe duties on textiles Aḫ-šalim brought would not have matched the discrepancy, 9 minas of tin. The palace would have demanded five textiles for the excise (nishšatum) and purchased ten more textiles for the tithe. At 20 shekels of silver each (the likely price for textiles, see note directly above), the fifteen Kutānum textiles would have been worth 5 minas of silver. Converted to tin at an 8-shekel rate (the price in silver for which the tin from Aḫ-šalim’s tin later sold), the duties on the textiles would have been 40 minas of tin; the nishšatum alone would have been 13% minas of tin.

26. In this caravan cycle, the length of credit terms influenced prices more than did the quality of goods, and goods sold on short terms were treated as though they were sold for cash. This can be seen by comparing the rates at which tin and textiles were valued at customs and on the market. Among the different lots, the likely standard-grade tin sold at 1/8 its weight in silver on short terms, but sold at 1/7 its weight

* See note to 8-BIN 4 26:41 above.

**The 12 šurum textiles in Lot 1 are priced at zero because they were bundled in with the tin (2-Prag I 426:50–52). The price of the lot suggests that the šurum textiles that were taken were those wrapping the tin.
All indications are that the representatives wrote the caravan account and its copy (2-Prag I 426) soon after the drivers arrived in town, the three sales having been transacted quickly. At the writing of the account, they had yet to settle with some of the drivers and they had yet to sell roughly a talent of tin (61 minas 10 shekels) left from Ab-šalim’s cargo. This last talent of tin, Lot 4, was sold later, as acknowledged by Šalim-āḫum (6-TC 3 23:4–8, 8-BIN 4 26:40–44). When all his goods had been sold on credit, Šalim-āḫum’s claims totaled slightly more than two talents of silver (127 minas 5 5/6 shekels). That the representatives wrote this caravan account before they sold all the merchandise and finished with the drivers suggests that Šalim-āḫum expected his representatives to provide information in a timely manner.

Despite the density of detail in the caravan account, our information is still fragmentary. In the surviving copy, the representatives did not include the precise due dates of the claims. As a result, we cannot express the length of each claim’s term in weeks or months as we can in other instances.27 However, Šalim-āḫum knew which claims would fall due first, second, third, and fourth with far more nuance than the caravan account’s “short terms” and “long terms” communicated; he reminded his representatives of their progressive maturation in later letters (6-TC 3 23; 8-BIN 4 26). Perhaps the copy of the caravan account sent to Šalim-āḫum did express the precise term lengths. He might also have had this information because the representatives also sent copies of the debt notes from the credit sales. Note that a different caravan account (BIN 4 61) from a different caravan cycle, written by Lā-qēpum and Ill-āḫum to Šalim-āḫum, expressed the number of weeks given for credit terms.

### Phase Three: Collecting the Claims

During the remainder of the caravan cycle, letters and shipments ebbed and flowed as Šalim-āḫum’s claims fell due, his representatives collected silver and sent it to him, and he acknowledged receipt. Before the Claim on Lot 1 fell due, Šalim-āḫum had sent two different letters to the representatives. The first letter (3-POAT 19) was written before he had received the caravan account (2-Prag I 426). In it Šalim-āḫum told his representatives, “my tin and textiles should not be stocked up” (3-POAT 19:3–5). Šalim-āḫum also reminded the representatives to report on the sale of goods when further transporters arrived (ll. 10–20). Subsequently Šalim-āḫum wrote about contemporary matters in Durḫumit, where three parties owed three debts (ll. 21–27). These claims were mentioned several more times in Šalim-āḫum’s letters during this caravan cycle (4-TC 1 14:23–30; 6-TC 3 23:25–27; 8-BIN 4 26:13–17): Aššur-šāmši’s sons owed a combined total of 10 minas 10 shekels of silver. Ḫinnaya was responsible for a debt of 21 minas 17 shekels of silver, which he had extended on credit on behalf of Šalim-āḫum (4-TC 1 14:27–30). Amur-Istar owed 5 minas of silver, for which Ḫinnaya was also responsible.

---

Shortly after writing 3-POAT 19, Šalim-aḫum sent another letter to the representatives (4-TC 1 14). Again Šalim-aḫum discussed the debts arising in Durḫumit (ll. 23–30). The subject matter of the two letters is so similar that they could almost be mistaken for variant copies. However there is a clear progression of events between the two letters, and Šalim-aḫum’s intent changes between the two. To begin with, in 3-POAT 19, Šalim-aḫum addressed only Lā-qēpum and Pûšu-kēn, the same two persons he addressed in Nūr-Ĭtar’s bill of lading (1-CCT 2 4b/5a:1–3). Later in 4-TC 1 14, he also addressed Ilī-ānum after learning from the caravan account (2-Prag I 426) that Ilī-ānum was helping to manage Šalim-aḫum’s affairs in Kaneš. The passage of time between the two letters is also marked by the development of one of the claims. In the first letter, Šalim-aḫum responded to a need for clarification about the claims related to Aššûr-šamši’s sons and Ḫinnaya, described the claims precisely, and instructed the representatives saying: “have all this paid and send it to me at the first opportunity” (3-POAT 19:25–27). Later Šalim-aḫum’s more terse language presupposed his previous comments on the matter: “… their terms are full. Let your report come” (4-TC 1 14:30–32). The movements of the transporters between the two letters also corroborate the forward progress of time. When Šalim-aḫum wrote 3-POAT 19, he asked Lā-qēpum and Pûšu-kēn to send a report as to when Dān-Ĕṣûr was to arrive in Kaneš. When he later sent 4-TC 1 14, Šalim-aḫum assumed that Dān-Ĕṣûr would have arrived by the time his letter did and asked the representatives to send Dān-Ĕṣûr home. When Šalim-aḫum later wrote 8-BIN 4 26, he acknowledged that Dān-Ĕṣûr had returned to Aššûr.

By the time they received Šalim-aḫum’s later letter (4-TC 1 14), his representatives had likely already begun to collect some of the silver Šalim-aḫum was demanding. They entrusted nearly 53 minas of silver and a letter to two transporters (Ennam-Ĕṣûr son of Šū-Ĕṣûr, Ėṣûr-mālik son of Erraya), keeping a memo of the amounts entrusted and witnesses present (5-VS 26 130). The amount of silver sent included silver for both the excise tax (nishuatum), paid at arrival in Aššûr at 2 percent, and transport tariff (šaduautum), paid to the transporters at a rate of 1.60. Because the surviving memo (5-VS 26 130) is damaged, it is difficult to determine how much silver was collected from whom in Anatolia. Some silver owed by the sons of Aššûr-šamši was paid through Ennam-Ăšûr son of Šū-Ĕnili (5-VS 26 130:3’–5’). At least 33% minas were collected from someone simply designated as “Ŝalim-aḫum’s merchant.” The latter must have been the buyer of Lot 1, though he had only paid about two-thirds of his debt. To total the 53 minas of silver sent, the representatives would have to have collected all of Aššûr-šamši’s sons’ silver (10 minas 10 shekels), plus ten more minas from others at Durḫumit (Ḫinnaya or Amur-Ĭtar). However, if Šalim-aḫum’s later letters are accurate, none of the persons from Durḫumit paid in full, since he mentioned later all as owing something (8-BIN 4 26:10–17).

When these first packets of silver arrived in Aššûr, Šalim-aḫum wrote a letter of receipt (6-TC 3 23). In it, Šalim-aḫum’s accounting essentially credited all the silver he received to the Claim on Lot 1 (ll. 9–14), despite the representatives having received some silver from Aššûr-šamši’s sons (5-VS 26 130:3’–5’). At the same time, Šalim-aḫum also noted that the Claim on Lot 2 was maturing. Though sold on long terms, this claim was falling due relatively soon after the first claim, which was sold on short terms—soon enough for Šalim-aḫum to assume the matter pertinent by the time his letter arrived in Kaneš. This could have been as soon as a month after the Claim on Lot 1 was collected, and probably not more than three months. In the last section of the letter Šalim-aḫum noted that the beulatum loans of some of the transporters, including Aššûr-muttabbil and Abš-šalim, were coming due (6-TC 3 23:36–41).

Once again, when the representatives received Šalim-aḫum’s letter (6-TC 3 23), they were likely already involved in collecting the maturing Claim on Lot 2. Again the representatives collected another 1½ talents of silver and sent the silver and a letter to Šalim-aḫum, keeping a copy of the letter for themselves (7-CCT 5 50b). Like the memo (5-VS 26 130), this copy is quite damaged, but the preserved parts discuss the silver shipped previously.

---

28. Though the actions described in the document were undertaken on behalf of Šalim-aḫum, it was not addressed to him, as they describe his buyer as “šalim-aḫum’s merchant,” and they describe the transport of the silver without the dative pronominal suffix, i.e., ubil instead of ubikkum.

29. For discussion of the transport tariff, see Dercksen, Old Assyrian Institutions, 156–63.
had likely spent roughly two talents (ca. 110 minas) on goods at the beginning of the caravan cycle. Even if he did not recoup those monies in the short run, he had already netted roughly two and half talents (152 amounts (ll. 35–40). stressed to the representatives to collect the silver and not to accept promises of interest paid in lieu of the principal soon, a fact he likely knew from the debt notes or their copies he had likely received earlier (ll. 40–48). He again stressed to the representatives to collect the silver and not to accept promises of interest paid in lieu of the principal amounts (ll. 35–40).

After 8-BIN 4 26 there is no later documentation on this caravan cycle. It is impossible to know whether Šalim-aḫum received the balance of his last two claims as smoothly as he appears to have received those on his first two. Even if he did not recoup those monies in the short run, he had already netted roughly two and half talents (152 minas) of silver, though as much as 36 minas of silver from this amount derived from the claims at Durḫumit. He had likely spent roughly two talents (ca. 110 minas) on goods at the beginning of the caravan cycle.

**The Documentary Topography of Šalim-aḫum’s Caravan Cycle: Šalim-aḫum’s Accuracy**

Less than a third, perhaps less than a fourth, of the original documentation created during Šalim-aḫum’s caravan cycle survives, yet no other single Old Assyrian caravan cycle is so well documented. Once it becomes clear that these eight documents form the remnants of an epistolary conversation between Šalim-aḫum and his representatives, the way in which the same assets are described during the epistolary conversation provokes questions about how accurate Old Assyrian merchants were in their communications. Thousands of Old Assyrian documents refer to assets held, owned, and sold. From the many detailed descriptions and occasional miserly comments, Assyrian merchants seem to have employed and expected a fastidious level of accuracy. In turn, we often draw on this sense of precision when judging whether two documents are connected or not. When considering

---

30. Šalim-aḫum never reported to his agents how much he initially paid for his goods. The estimated amount is attained by combining average prices in silver for the goods and services involved: tin (4 shekels of silver for a mina of tin), textiles (katānum, 5 shekels of silver; very fine katānum, 9 shekels of silver; šîrum, 2 shekels of silver), donkeys (30 shekels of silver each), tallow and fodder (5 shekels), “hand tir” (40 shekels of silver), exit tax per donkey (waṣṣatum, 2 shekels of silver), and payment to transporters (15 shekels of silver).

31. At the time Šalim-aḫum bought and shipped the goods, he drew up at least a dozen documents, including transport contracts, bills of lading, a letter of notification, and memos for his own records. When the goods arrived in Kāneš, the representatives created at least another eight documents: three debt notes with copies (or a memorandum for Šalim-aḫum), the caravan account and its copy, and perhaps another memo for their own records. It is also not unlikely that the transporters on the journey sent a few letters. Afterward, when the representatives collected funds, they made memos like 5-VS 26 130 and when they sent letters they kept copies like 2-Prag I 426 and 7-CCT 5 50b. Šalim-aḫum did not hesitate to send four letters during the caravan cycle, and he doubtless sent other letters as well. All told the total documents including memos would have easily passed thirty, if not three dozen, tablets.

32. Such skepticism would have hindered a detour in clarifying the difference between Kültepe Level II and Level Ib in an earlier phase of scholarship on the old Assyrian trade. When the chronology of the Boğazköy and Alişar Old Assyrian texts was still unclear, J. Lewy argued that the Old Assyrian texts found in Alişar and Boğazköy belonged in the period of Kültepe Level II (rather than Level Ib) on the strength of, among other things, the same name mentioned in texts from the three different locations: J. Lewy, “Apropos of a Recent Study in Old Assyrian Chronology,” Or 26 (1957) 16–20. Kemal Balkan had correctly argued earlier that the texts from Alişar and Boğazköy were contemporary with Level Ib, appealing to orthographic and linguistic evidence; see K. Balkan, *Observations on the Chronological Problems of the Kûrum Kanîş*, Türk Tarih Kurumu Yayınları 7/28 (Ankara: Türk Tarih Kurumu, 1955).
whether or not to connect two caravan documents, M. T. Larsen explained, “We cannot know whether another shipment of exactly the same size, involving the same persons, etc. has been recorded on other tablets lying in the yet undug houses of Kültepe or in museums or perhaps irretrievably lost.” But in the epistolary conversation from this caravan cycle, Šalim-aḫum was less precise than we might have expected and less precise than a sense of fastidious accuracy suggests—and his variations are not such that they can be explained by appeal to errors in copying cuneiform numbers. At the same time, at least three different contexts can be differentiated that serve in part to explain when Šalim-aḫum was precise, and when more approximate descriptions were permissible.

Table 3 lists figures for Šalim-aḫum’s assets reported more than once in the caravan-cycle documentation (figures entirely reconstructed are omitted). The columns listing documents are ordered chronologically, with those documents composed by Šalim-aḫum shaded in gray. The row entries are divided into three sections, with references to claims in the top section, references to actual silver received in the middle section, and references to other contemporary debts owed to Šalim-aḫum in the bottom section.

There is a range of discrepancies both among Šalim-aḫum’s own descriptions of his assets and between his reports and those of his representatives. Many figures match exactly, such as the amount for Silver Packet 2: consistently 21 minas 10 shekels across four documents composed both by Šalim-aḫum and the representatives. Some discrepancies are insignificant: Šalim-aḫum listed Silver Packet 1 as 31 ½ minas of silver plus transport tariff (6-TC 3 23:10–11), but in the second letter of receipt he recorded 31 minas 15 shekels of silver plus ½ mina transport tariff (8-BIN 4 26:18–19). But some discrepancies are instructive: Šalim-aḫum precisely described the debt owed by Aššur-šamiš’s sons (10 minas 10 shekels) and, by subtraction, the debt of Hinnaya (21 minas 17 shekels) in the first letter dealing with the topic (3-POAT 19:21–24), but varied in his precision when describing the assets thereafter. In one place, he described the debt of Aššur-šamiš’s sons as 10½ minas and Hinnaya’s debt as 21 minas (4-TC 1 14:23–29); still later the total of the two debts was approximated as 31½ minas (8-BIN 4 26:10–12). One discrepancy suggests that more detail does not necessarily mean more accuracy: the representatives cited the Claim

34. Most of Šalim-aḫum’s errors involve the presence or omission of a ½ shekel, the decision to render a figure only in minas and half minas (as opposed to minas and shekels), or some other variation that does not lend itself to missing a vertical wedge in a cuneiform number. The author collated 8-BIN 4 26, consulted the photos of 3-POAT 19 and 5-VS 26 130 (http://www.cdli.ucla.edu), and appealed to M. T. Larsen’s collations for the tablets at the British Museum (1-CCT 2 4b/5a; 7-CCT 5 50b).
on Lot 1 as 54 minas 45 shekels in their copy of the caravan account (2-Prag I 426:54), and Šalim-aḫum cited the same amount in one document (6-TC 3 23:9), but later credited himself 54 minas 45 and ½ shekels (8-BIN 4 26:3). Given the consensus between Šalim-aḫum’s earlier amount and the copy of the representatives’ document, which is closest to the event, it seems like Šalim-aḫum was inflating his claim.

When specific aspects of the caravan cycle are described differently in various documents, we gain valuable information. For example, it is clear that a transporter named Aššur-mālik in one letter (6-TC 3 23:12–13) was the same person referred to as Erraya’s son in another missive (8-BIN 4 26:21–23), and not one of the more than one hundred other men named Aššur-mālik attested in the Old Assyrian corpus. But when amounts of assets diverge, determining which figures were valid becomes difficult. Were there conditions that prompted one level of precision over another? It seems Šalim-aḫum intuitively matched his level of accuracy to at least three different contexts, which I will style conversational, legal, and accounting.

The most consistent divergences in figure amounts seem to come in documentary contexts that could be described as conversational. In many instances, Šalim-aḫum mentioned assets in an ongoing discussion and needed only to distinguish sufficiently the asset from a finite number of other active assets under the care of his representatives—not a terribly difficult task when constantly exchanging letters. As already mentioned, when we first pick up the debts of Aššur-šamši’s sons and Ḫinnaya originating from Duruḫumit in the epistolary conversation, Šalim-aḫum was taking pains to clarify the exact amounts (10 minas 10 shekels, 21 minas 17 shekels, 3-POAT 19:21–24). Later, when he referred to these same claims, he cited approximated or combined figures (10½ minas, 21 minas, and combined as 31½ minas) sufficient for recognition by the representatives—and by ourselves. In this context, Šalim-aḫum seemed to gravitate to full- and half-mina amounts. In the broader contexts of Old Assyrian communication, it was common for merchants to use approximations, such as when quantifying their tin on the road in terms of “talents;” approximating the 65 mina load of the šuqûlu packs. Šalim-aḫum certainly did (TC 1 26:14–15). When the amounts were hypothetical, such as in requests, approximate numbers were often used. When Šalim-aḫum asked Pūšu-kēn to send silver from Šalim-aḫum’s purse in Kaneš on other occasions, he asked for hypothetical amounts, like 20 minas of silver (AKT 3 72:4–6; TC 2 1:22–24) or 30 minas of silver (KTS 1 42d:14–16, 32–33; TC 2 1:14–16). According to Šalim-aḫum’s letters, such approximations were acceptable when discussing concrete assets as well.

In contrast to conversational contexts, Šalim-aḫum obviously needed to be precise in documents with legal force. Only one document from this caravan cycle fits this category. When Šalim-aḫum drew up Nūr-Ḫṣar’s bill of lading in Aššur (1-CCT 2 4b–5a), both Šalim-aḫum as the owner and Nūr-Ḫṣar as the driver would have checked that the stated amount of cargo was accurate, as the recorded figures became legally binding. The other bills of lading, any transport contracts, and the debt notes drawn up by Šalim-aḫum’s representatives and the buyers (none of which survive) would also have fallen into this category. We should expect figures in legal documents to reflect the most binding description of assets, and when matching together two legal documents, there is the expectation that figures would match exactly or betray a rearrangement of circumstances in the interim between their creation.

Between conversational and legal communications, there existed communications between principals and agents where accuracy was more meaningful but apparently not legally binding. Šalim-aḫum needed to make intermediate accountings with his representatives, separated from him by the long distance between Aššur and Anatolia. Šalim-aḫum’s communications in this context of accounting exhibited formal characteristics. The format of two letters of receipt sent by Šalim-aḫum (6-TC 3 23; 8-BIN 4 26) both follow similar patterns as highlighted in table 4. In both letters, Šalim-aḫum listed (1) claims due (or past due), followed by (2) money received towards those claims; he then listed (3) claims coming due. In both letters, Šalim-aḫum included (4) instructions to collect the principal quickly and (5) additional comments as necessary. The progression of sections reflects both a systematic approach to the accounting and a temporal development: first the previous state of the caravan cycle is discussed (those debts that have come due), then the current state (the silver received towards the claims due and the balance due), and finally, instructions pertinent to the time the letter would arrive at its destination (collecting the balance of claims due and those claims coming due). The two letters of receipt Šalim-aḫum wrote could be

Termed *intermediate accounts*, and potentially we might add this designation as another “Standard Text” alongside the transport-contract, notifying message, and caravan accounts.\(^{35}\)

The formal characteristics of these two intermediate accounts suggest a pragmatic and methodical accounting. Again, connections between documents reveal information: Lulu son of Zukūḫum’s debt in the second interme-

---

diate account (8-BIN 4 26:8–9) matches exactly the Claim on Lot 2 from the caravan account (2-Prag I 426:14), revealing Lulu as the buyer of Lot 2. However, several of Šalim-aḫum's accuracy errors occurred in this context, and most are slight or subtle. In the first intermediate account, Šalim-aḫum made one deviation against the caravan account, approximating silver received but ignoring the transport tariff (his cost), thus inflating the balance outstanding for his representatives by 15 shekels (6-TC 3 23:10–14). In the second intermediate account (8-BIN 4 26), Šalim-aḫum made two errors. He inflated the Claim on Lot 1 by ½ shekel (ll. 3–6), and when he listed two of the Durḫumit debts as one entry (ll. 10–15), he inflated their total by three shekels over the total expressed in an earlier letter (3-POAT 19:21–27). In the context of making intermediate accounts, Šalim-aḫum was more precise than in a conversational context, but slightly less accurate than what we might expect in legal frameworks.

The documents from Šalim-aḫum's caravan cycle show that Old Assyrian merchants’ attitudes toward accuracy could be nuanced. This has implications for pursuing reconstructions of activity across documents. We should still demand a higher threshold of accuracy in the transporting phase of trade where the regularity of the donkey-load and the taxation system dictated that most goods were transported, or at least booked, in packages of nominally the same size and where many documents had legal force. Likewise, in debt notes and other documents with legal force small differences in descriptions are more consequential. However, Šalim-aḫum's differing levels of precision in differing contexts suggests that in other phases of the trade and in other documentary contexts, similar descriptions of assets—even when not described precisely the same—may refer to the same assets. Lots sold and claims on lots were less standardized in size and amount, and at least some merchants felt free to be less precise in their communication. When pursuing reconstructions of Old Assyrian documentation, context—and perhaps the disposition of individual authors—can affect the threshold of accuracy one can expect when considering connections between documents. But differences in accuracy can also be read to betray other phenomena, including the social distance between individuals. I will follow this thread further when discussing Šalim-aḫum's representatives below.

Charting the Social Topography of Šalim-aḫum's Caravan Cycle: Transporters, Buyers, Representatives

If Šalim-aḫum’s varying descriptions of assets highlights one dimension of Old Assyrian communication, his interaction with the range of participants in his caravan cycle also brings into focus other aspects of his mercantile activities. It seems Šalim-aḫum needed a reasonably large pool of persons to draw on for different services in order to participate as a wholesale dealer in the trade, but that few of these persons needed to be tied to him in a durable way. The various persons involved in the caravan cycle can be parsed into three different functional groups: (1) those who transported his goods, (2) those who purchased his goods, and (3) those who represented his interests in Anatolia. A number of patterns emerge in Šalim-aḫum's epistolary conversation that suggests he conceived of most of these persons as outside his sphere of liability in one way or another. Šalim-aḫum made use of a range of drivers because the trade demanded flexibility in finding people to fill that role. But aside from his son, none of these drivers can be confidently established as his durable employees. Šalim-aḫum also showed little interest in the identity of “his” buyers, who bought his goods in Anatolia, revealing a social distance between the two parties and suggesting that linguistic markers, like possessives, cannot always be interpreted as markers of social or organizational closeness. Finally, Šalim-aḫum seemed to subtly shift small amounts of liability onto his several representatives in Anatolia through his intermediate accounts, suggesting he was only secondarily interested in their short-term financial welfare. The following three sections deal with each of these groups.

Šalim-aḫum’s Transporters: Employees or Transport for Hire?

Those who transported Šalim-aḫum's goods formed an important part of Šalim-aḫum's caravan cycle. No fewer than sixteen different persons were involved in transporting goods for him as mentioned in the documentation
Table 5. List of Transporters Involved in Šalim-āḫum’s Caravan Cycle.

SOCIAL TOPOGRAPHY OF AN OLD ASSYRIAN CARAVAN CYCLE

from this caravan cycle. Many drivers only made a single one-way trip for Šalim-āḫum during this period. All three of his representatives also transported goods. But it is only occasionally clear whether or not some drivers were really part of Šalim-āḫum’s durable commercial network. Though Šalim-āḫum likely met each of these transporters personally, their social connection to him is difficult to configure.

The number of Šalim-āḫum’s transporters during the period of this caravan cycle is surprisingly broad, an observation underscored by noting that two of the entries in table 5 that could be the same person in fact are two different persons. It is onomastically possible that Aššur-mâlik son of Errâya could have been the same person as the one called the son of Erra-idî, but the activities of the two overlapped in ways that distinguishes them as separate persons.66

From the evidence relating to this caravan cycle, only two transporters besides Šalim-āḫum’s representatives might have been working exclusively for him. Both Aššur-mâlik son of Errâya and Dân-Aššûr, Šalim-āḫum’s son, brought goods to Kanes, then brought silver back to Aššur. It is possible that Šalim-āḫum had either exclusive or primary control over these two persons. As his son, Dân-Aššûr’s long-term welfare was bolstered by Šalim-āḫum’s financial well-being, and Dân-Aššûr behaved towards his father within a framework of family obligation.67 But if Šalim-āḫum had exclusive control over Aššur-mâlik son of Errâya during this caravan cycle, it was not likely permanent. Aššur-mâlik seems to have operated as an independent merchant elsewhere and there is more evidence of his tie to Pûšû-kên than to Šalim-āḫum.68

---

66. Erra-idî’s son brought cargo for Šalim-āḫum from Aššur early in the caravan cycle that was mostly sold in Lot 2. On the other hand, Aššur-mâlik son of Errâya brought silver from Kanes to Šalim-āḫum later in the cycle, which Šalim-āḫum acknowledged in the first letter of receipt (6-TC 3 23:12–13). Šalim-āḫum did mention both Aššur-mâlik without his patronym and the son of Erra-idî in the first letter of receipt (6-TC 3 23:12–13, 17–19). However, Šalim-āḫum indicated in an earlier letter that Aššur-mâlik son of Errâya arrived with Dân-Aššûr at a different time (3-POAT 19:10–11). Moreover, Šalim-āḫum consistently referred to the son of Erra-idî by his patronym while Aššur-mâlik’s name was the essential referent for him.

67. In a more dispersed way, the documentation arising from the archive associated with Dân-Aššûr and his brother Ennam-Âššur attests to the fact that the two sons did coordinate activities with their father and certainly on occasion were directed by their father. For a fuller discussion of the family as functioning as a family firm, see references in n. 5.

68. In KEL 105, Aššur-mâlik son of Errâya was recorded as owing 1 mina 41 shekels of silver to a merchant (AKT 1 49). Aššur-mâlik was witness to an agreement between two other merchants (AKT 1 66). He is part of a distribution of textiles recorded in another document where twenty-three other persons also receive or are credited with 1 kirum, while two persons receive or are credited with two kirûmûm (CCT 5 42a:22–23: 1 kirû-am Aššur-mâlik DUMU Er-ra-a). There is a receipt recording Pûšû-kên paying the kirûmûm for the transport tariff on 4 talents tin (1½ minas of silver), which apparently Aššur-mâlik brought, but there is interest attached, so this is a loan of some kind. Aššur-mâlik also
While the evidence is not conclusive, it seems that several of the other transporters also had more direct connections to Pūšu-kēn than Šalim-āğüm. The record on the activities of Aššūr-mālik son of Luzina show him coordinating activity with Šalim-āğüm and Pūšu-kēn, but also pursuing independent activity. Aššūr-muttabbil son of Šū-Anum is attested owing silver to someone in Pūšu-kēn’s circle. Likewise, Ennam-Aššūr son of Šū-Aššūr shows up in the same circle as Pūšu-kēn. Amurrum-bānī son of Puzūr-Iṣtar and Nūr-Iṣtar son of Idi-Iṣtar are otherwise unknown; the rest of the transporters do not have patronyms in these documents, and therefore cannot be confidently tracked for this study. To some extent, if he was to respond to developing conditions at either end of the caravan route, Šalim-āğüm could not have relied on a small group of transporters. Clearly he could have contracted with transporters through an agent. But he also seems to have drawn on some transporters on a regular basis, such as Aššūr-mālik son of Erraya, Aššūr-mālik son of Luzina, Aššūr-muttabbil son of Šū-Anum, and Ennam-Aššūr son of Šū-Aššūr, all of who reappear elsewhere in the business activities of Pūšu-kēn. Some of these transporters may have spent their entire lives as transporters in the trade, but if so, they worked at transporting for a range of different people.

Can we determine differences in the ways in which Šalim-āğüm related to the various transporters in the caravan cycle based on lexical grounds? Nūr-Iṣtar was paid the wages (igrū) of a sāridum (“packer”), as mentioned by Šalim-āğüm in the bill of lading (1-CCT 2 4b/5a:10), whereas three of the drivers, Aššūr-muttabbil, Aḫ-Šalim, and Amurrum-bānī, were paid with working capital (be‘ūlātum), which they were to pay back a few months after they reached Kaneš (6-TC 3 23:35–42). Unfortunately, the difference between description (sāridum vs. kaṣṣārum) on the one hand and mode of payment (igrū vs. be‘ūlātum) on the other are not clear in the caravan cycle. It has been proposed that a kaṣṣārum would have functioned as an important and regular employee for firms, as opposed to a sāridum. In general, documents refer to “the kaṣṣārum of PN,” whereas there are no examples of an equivalent “sāridum of PN.” There are no examples of wages being paid to a kaṣṣārum, whereas sāridā were commonly paid wages. Thus it might be worth proposing that kaṣṣārum were usually paid with a be‘ūlātum, and hence more likely employees. But of the transporters paid by be‘ūlātum in the caravan cycle, only one clearly persists beyond this caravan cycle as a member of Šalim-āğüm’s or his representatives’ circles—Aššūr-muttabbil, who continues to
show up in Pūšu-kēn's circle (not Šalim-aḫum's). As a result, it might be premature to map kasārum and sāridum as employed versus contracted labor.45

Šalim-aḫum's transporters played an important role in his caravan cycle. However, beyond Šalim-aḫum's own son, whose travels Šalim-aḫum directed through his letters to his representatives, it is difficult to associate any other transporter directly to Šalim-aḫum, especially as an employee whose travels Šalim-aḫum directed. Lexical descriptions of roles do not offer much help in describing Šalim-aḫum's relation to the transporters as well, though social dynamics may have some effect on whom Šalim-aḫum paid with a be'ulātum and whom he paid differently. The difficulty in mapping degrees of stability onto Šalim-aḫum's social relationships with his transporters echoes a similar problem of describing his relationship to those who bought his goods.

**Šalim-aḫum's Buyers and Our Purchase on Language**

Šalim-aḫum depended on a second group of people to make his profit: those who purchased his goods. In this article I have described the transaction between this group and Šalim-aḫum as a credit sale. Some descriptions of the Old Assyrian family firm would likely identify these transactions with other instances of giving commission goods to travelling or commission agent. Šalim-aḫum's representatives would have drawn up a bond (the debt note) with the commission agent that stipulated when he would return a set amount of the proceeds, keeping further proceeds as his profit.46 Such descriptions, where both the English "commission" and "agent" imply that the goods entrusted were still owned by the original merchant until payment was received, have been at least indirectly supported by understanding phrases like, "my merchant" or "our PN" to imply durable relationships between parties involved in the transaction, even an employer–employee relationship.47 However, a further look at the documentary topography of this caravan cycle suggests that Šalim-aḫum treated the transaction as a credit sale. Šalim-aḫum's inconsistent use of possessive markers to refer to the buyers suggests that such markers do not provide, in and of themselves, evidence of durable relationships between individuals. Šalim-aḫum's discussion, or lack of discussion, of his buyers' identities implies there was a certain social distance between the two parties. Such distance is confirmed by a reconsideration of the structure of the caravan cycle.

In the first place, Šalim-aḫum's use of possessives with "his" buyers suggests that our purchase on the language of relationships is relatively insecure. Šalim-aḫum occasionally referred to a buyer or buyers as "my merchant(s)" in the epistolary conversation. In one letter, Šalim-aḫum wrote, "The term of my merchant to whom you extended credit in Kanēs is full. Take care to make my merchant pay the silver ... the terms of the merchants, those which are still running, of all of my merchants—their terms are full" (4-TC 1 14:4–8, 19–22). But when the caravan cycle began, Šalim-aḫum made no effort to designate specific persons who might buy the goods, writing to his representatives, "Your merchants must be reliable" (1-CCT 2 4b–5a, see also CCT 5 5a:13–21).48 After the buyers transacted...
business with his representatives, Šalim-aḫum's use of possessive markers for "his" buyers suggests the silver they owed him was much more important than any social relationship they may have shared. Šalim-aḫum's language never projected a close relationship between both "his" buyers and his assets, for example, "Have my merchants sold my goods?" His focus rather lay in consummating his relationship with his silver, writing of the buyer or buyers, "Make him/them pay" (3-POAT 19:26; 4-TC 1 14:8; 6-TC 3 23:42; 8-BIN 4 26:36, 47). In this caravan cycle, when Šalim-aḫum used possessives in referring to merchants who owed him money, he was identifying the ownership of his claims on silver rather than his relationship to the buyers. As a result, the same passage above could be translated differently by directing the reference of the possessive to Šalim-aḫum's assets, for example, "The term of the merchant to whom you extended my credit … the terms of the merchants, those which are still running, of all (those) merchants (who have) my (silver)—their terms are full."

Šalim-aḫum's ambiguous relationship to the buyers is reinforced by the interpersonal topography of the epistolary conversation, where the buyers occupy a position more distant from Šalim-aḫum than either transporters or representatives. The personal identities of the buyers of the four lots is the most elusive social information in the cycle. Though there were many opportunities to mention their names, Šalim-aḫum or his representatives only referred to one buyer by name: Lulu son of Zukuḫum, who bought Lot 2 (8-BIN 4 26:8–9). The general disinterest in the buyers' names during the caravan cycle stands in stark contrast to the attention paid both to Šalim-aḫum's assets and the transporters who brought them to Kaneš.

Šalim-aḫum's assets took three forms through the various phases of the caravan cycle, first as goods transported to Anatolia and sold, then as claims on merchants for silver, then as silver collected and sent back to him. In American accounting language this would correspond to inventory, receivables, then cash. Yet Šalim-aḫum distinguished his assets by associating them with the original transporters, even when his assets had been transformed into claims and then silver. Šalim-aḫum referred to the claims on silver as "from the goods from the transport of" (ina/ša ṭuqštim ša šēp) or more simply "from the cargo of" (ša šēp) the transporters.49 This did not mean that the drivers purchased the goods upon arrival in Kaneš, as demonstrated by the case of Lulu. And Šalim-aḫum consistently described the debts owed by transporters, such as their be’ulattum, simply as ša PN, rather than with the ša šēp PN formula (6-TC 3 23:35–42).

While Šalim-aḫum's tendency to refer to his assets consistently in relation to the original drivers facilitates tracking his assets through the three phases, it also suggests something about Šalim-aḫum's conception of the caravan cycle and the nature of his assets. Šalim-aḫum's conception of the caravan cycle was configured by the first phase, implying a perceived continuity of existence for the caravan cycle as a definite iteration of business. By tracking his assets with reference to the first phase through the second, rather than associating the assets with the persons who held them, Šalim-aḫum conveyed a consistent disinterest in persons beyond his representatives and transporters. But Šalim-aḫum's mode of referring to his claims also suggests a level of anxiety that came with transformation of his assets from tangible goods to a less tangible claim. Šalim-aḫum was in no way uncomfortable with the idea of credit—he no doubt constantly extended credit to merchants in selling his goods—but by continuing to refer to his assets in their previous concrete state, Šalim-aḫum reiterated the loss of that state.

Some basic aspects of the caravan cycle and the typical documents employed to forward the process support characterizing these transactions as credit sales. Typically, in the transport phase of the caravan cycle, the owner signaled his retention of ownership by "laying his hand" on the merchandise, noted in the transport contracts.50 The transporters later turned over the goods to the representatives when arriving in Kaneš. There, when Šalim-

49. All of the lots in the caravan cycle are described in this manner: Lot 1 (6-TC 3 23:9–10; 8-BIN 4 26:3–4); Lot 2 (6-TC 3 23:17–19); Lot 3 (8-BIN 4 26:45–46); and Lot 4 (6-TC 3 23:5–8; 8-BIN 4 26:41–42). The phrase ša šēp PN is parallel to the less frequently attested phrase ša luqštim ša šēp PN (TC 1 106:6–8), also reconstructed in 6-TC 3 23:15–19. See Larsen, Old Assyrian Caravan Procedures, 169–70; Ulshofer, Privatarkunden, 263.

50. For laying hands on goods (qātam šakānum), see Larsen, Old Assyrian Caravan Procedures, 28–32.
aḫum’s goods were not sold all at one time, he urged his representatives to sell for a cheaper price on the market (3-POAT 19). The representatives’ report on the varying prices for which the different lots were sold reflected negotiated prices (2-Prag I 426). Šalim-aḫum’s representatives sold his goods in exchange for a claim on silver, the typical debt note serving as proof of ownership of the intangible asset. No “laying the hand” procedure seems to have occurred at this point. By their very form, the debt notes that pervade the Old Assyrian trade listed only the silver owed, attesting to the irreversible nature of the transaction. After the sales, Šalim-aḫum only carried credit risk—he no longer carried any risk as to the valuation or condition of the goods.31 Thus the buyers served as an important point at which both the nature of Šalim-aḫum’s assets and risks were transformed.

Šalim-aḫum benefited when he sold to people who were reliable but did not share a social or financial connection with him close enough to request leniency when it came time to collect. Šalim-aḫum’s relative disinterest in the identity of “his” buyers, combined with the way he varied in claiming relationship to them, cautions against interpreting some linguistic tokens as direct indicators of organizational or durable relationships. Šalim-aḫum’s relative indifference to the identity of his buyers suggests that in this caravan cycle he was buying wholesale on the market in Aššur and selling (on credit) wholesale on the market at Kaneš. At least in this caravan cycle, the buyers did not comprise part of Šalim-aḫum’s durable commercial network or his employees. However, his mode of transacting business with them, on the market, likely conditioned similar arrangements he would make with persons within his social or commercial network.

**Šalim-aḫum’s Representatives and Šalim-aḫum’s Interests**

Perhaps the most important group for Šalim-aḫum consisted of representatives in Anatolia who coordinated the transition from shipments to sales, collected his claims, and sent his silver off to him in Aššur. The epistolary conversation in this caravan cycle was conducted with this group. Yet a close reading of the epistolary conversation sorts them not as Šalim-aḫum’s employees but as independent associates. Šalim-aḫum drew on a small but flexible pool of merchants whose movements he did not directly control. Moreover, Šalim-aḫum’s interaction with his representatives suggests a tension between the two parties. While he cultivated personal relationships with these men, he also maintained subtle financial distance from them. Šalim-aḫum and his representatives kept separate balance sheets, a fact that Šalim-aḫum, either wittingly or unwittingly, exploited in small ways with loose language that had a soft effect of potentially displacing small amounts of risk onto his representatives. Such behavior suggests that Šalim-aḫum’s representatives were an important part of his commercial network, but not, strictly speaking, part of Šalim-aḫum’s firm.

Like transporters, Šalim-aḫum seems to have drawn on a small but fluid group of representatives rather than a cadre of stationary employees. Šalim-aḫum’s representatives had their own affairs and movements, so Šalim-aḫum needed to have multiple representatives to accommodate situations when some of his representatives turned their attention elsewhere. Three different persons represented Šalim-aḫum in Kaneš during the caravan cycle: Pūšu-kēn, Lā-qēpūm, and Iš-ālūm. In addition, ḫinnaya seemed to represent Šalim-aḫum in Dūrḫumit (4-TC 11 14:27–30). The recovered documents reviewed here were most likely stored in Pūšu-kēn’s archive. Pūšu-kēn and Lā-qēpūm consistently appear as addressee or addressee in all the letters where the pertinent section is preserved, whereas Iš-ālūm entered and exited duties of representation for Šalim-aḫum without Šalim-aḫum’s direction. As reviewed in the reconstruction, Iš-ālūm did not represent Šalim-aḫum until after the goods made their way to Anatolia, and Šalim-aḫum learned of it ex post facto. Later, Iš-ālūm returned to Aššur, leaving the business to be handled by Pūšu-kēn and Lā-qēpūm (8-BIN 4 26:28–29). The documentation also suggests that neither Lā-qēpūm nor Pūšu-

---

kên were consistently stationed in Kaneš to continuously oversee Šalim-aḫum’s affairs. Šalim-aḫum mentioned claims arising from goods brought to Anatolia from Aššur by both men in the recent past (4-TC 1 14:16–18; 6-TC 3 23:15–17; 8-BIN 4 26:6–7).

A sense of social and commercial distance between Šalim-aḫum and his representatives also comes through in the texture of the epistolary conversation. Both Šalim-aḫum and his representatives describe or discuss assets or persons as the exclusive domain of Šalim-aḫum, rather than as shared assets. For example, Šalim-aḫum did not say how much silver he paid for the “extremely fine” textiles brought by Nūr-Ištar (1-CCT 2 4b/5a). Nor did he tell his representatives how much silver he spent on his goods in other notifying messages he sent in conjunction with other shipments (TC 3 21; CCT 2 4a). These facts were information he did not feel obligated to share, because each merchant carried a distinct balance sheet of profits and losses. Likewise, when the representatives recorded that they received silver from “Šalim-aḫum’s merchant,” (5-VS 26 130:6–8’), who should be identified as the buyer of Lot 1, they project the same social distance to the buyer and to Šalim-aḫum as observed between Šalim-aḫum and “his” buyers.

Šalim-aḫum also treated the act of accounting between himself and his representatives as one between separate parties, though outside of a legal sphere. Šalim-aḫum’s communication with his representatives in this context highlights at once the close relationship between his representatives and their own independent liabilities. As mentioned earlier, Šalim-aḫum had a tendency to be less accurate when making accounts with his representatives than he was in legal documents. Šalim-aḫum’s problem with precision was not likely due to problems with record keeping or to lack of records. If he was anything like Pūšu-kên, whose archive supplied these documents, then he was keeping many documents associated with the caravan cycle, both copies of letters he sent away and those he had received. Moreover, Šalim-aḫum showed that he knew when claims matured, reminding the representatives to collect the claims in a timely manner several times during the caravan cycle. Furthermore, he also clarified the amounts of assets on occasion, as with the first time he mentioned the debts in Durḫumit in the epistolary conversation (3-POAT 19:21–27). In the two intermediate accounts (6-TC 3 23; 8-BIN 4 26) Šalim-aḫum was both more formal and more precise (made smaller errors) than in some other letters. But the small discrepancies in two of his figures in the intermediate accounts had their effect on the intermediate balances, which Šalim-aḫum claimed between himself and his representatives. Šalim-aḫum’s errors totaled only 3½ shekels of silver, but they might suggest something subtle because they were both in his favor. If his representatives were obligated to accurately report Šalim-aḫum’s assets, Šalim-aḫum did not feel obliged to the same degree.

If this subtle pattern of inflating figures can be taken for intentional communication, then Šalim-aḫum could be seen to have displaced small amounts of risk onto Pūšu-kên and the other representatives by attempting to oblige them to send more silver than was actually due. Šalim-aḫum’s minor errors in his favor in the intermediate accounts might not comprise an outright attempt by Šalim-aḫum to cheat his representatives. Pūšu-kên or the other representatives would not likely have been fooled by the small errors, nor considered them serious. However, seemingly small amounts of goods or silver could mean a great deal to Šalim-aḫum. When another merchant, Ilabrat-bâni, took 6½ minas of tin (worth about 1 mina silver) from Šalim-aḫum’s goods while transporting them to Kaneš, Šalim-aḫum reacted very angrily (see BIN 4 61; TC 2 3; POAT 7). Šalim-aḫum’s tendency toward accounting errors suggests that Šalim-aḫum might have felt he could occasionally gain something from them; but this may be reading too far into the variances.

Still, there are reasons to take Šalim-aḫum’s imprecision seriously, even if he may have not. In legal contexts, when a document was created, all parties or their representatives were present to ensure its accuracy. By contrast, Šalim-aḫum and his representatives, by design, in different places. Though the intermediate accounts lacked witnesses of both parties’ acceptance of the document and thus legal force, Šalim-aḫum’s list of silver still to be collected was a statement of responsibility for his representatives. Šalim-aḫum’s descriptions were reasonably accurate, and he did not risk the same consequences of misstating assets in a legal statement. And yet, if Šalim-aḫum frequently inflated his claims in intermediate accounts with his representatives, some tension between he and his representatives was likely to arise. After all, the representatives were keeping copies of the letters they sent (2-Prag I 426; 7-CCT 5 50b) and their own documentation (5-VS 26 130).
Conclusions

Šālim-āḫum's caravan cycle constitutes the most well-documented example of a common sequence of activity in the Old Assyrian trade. The manner in which Šālim-āḫum pursued his caravan cycle does not comprise the only approach employed by merchants participating in the Old Assyrian trade. Nor does it represent a complete characterization of Šālim-āḫum's business. But the reconstruction afforded by the documentation provides an opportunity to sift between language and practice and permits a consideration of the social topographies possible in accomplishing the trade.

While selecting Šālim-āḫum's caravan cycle means looking narrowly at a single process, it well manifests a productive dialectic between language and practice in describing the Old Assyrian trade. Evaluating the reliability of reconstructions of merchant activity has in part hinged on agreement of descriptions of assets and other aspects across documents. However Šālim-āḫum's occasionally loose descriptions of his assets obscure some of the simplest material elements of the caravan cycle, suggesting that in some contexts, such as when assets are merely being identified for general purposes, there is reason to expect less precision than in legal documents. Šālim-āḫum's epistolary conversation with his representatives during this caravan cycle also suggests that linguistic markers do not in and of themselves portray social facts of the trade. Šālim-āḫum's tendency to refer to buyers as "his" merchants seems a misleading indicator of any social closeness between them. The formality of the intermediate accounts ordered a portion of the epistolary conversation between Šālim-āḫum and his representatives. Yet within the context of that formality, Šālim-āḫum still seemed to manifest evidence of competing interests with his representatives. Recognizing variations in detail as part of a conversational context, or perhaps a manifestation of conflicting interests, suggests wrinkles in validating reconstructions of discrete events drawn from a mass of seemingly homogeneous commercial activity.

Šālim-āḫum's caravan cycle and its epistolary conversation also project a social topography that reveals Šālim-āḫum's commercial network in this cycle as distinct from that associated with larger family firms. Other merchants in the Old Assyrian trade, such as Imd-ilum, operated within family firms in which extended family formed the core of a large commercial network of cooperating merchants. In the case of Šālim-āḫum's caravan cycle, we cannot finally verify that most of his transporters and even his representatives may have been related to him in some way to him. No model of the family firm demands that everyone Šālim-āḫum worked with was related to him. But in Šālim-āḫum's caravan cycle, attempting to sort between the participants who had a durable commercial relation to Šālim-āḫum or shared in his short-term commercial interests—persons we might associate as employees or members of his firm—is like peeling away successive layers of an onion until effectively only Šālim-āḫum and his son remain. Šālim-āḫum made use of a seemingly flexible supply of transporters, buyers and, to a lesser extent, representatives, to pursue this caravan cycle. And though Šālim-āḫum dictated the movements of his son Dān-Aššur, his son was flanked by a larger group of transporters who cannot be confidently characterized as Šālim-āḫum's employees. Likewise, Šālim-āḫum's buyers met Šālim-āḫum's representatives in the context of the market rather than in the context of a firm. Šālim-āḫum's representatives, including Pūšu-kēn, Lā-qēpum, and Ilī-ēlum, and likely also Ḫinnaya, appeared as coordinating associates but not exclusive employees, entering and exiting the caravan cycle without Šālim-āḫum's direction, and perhaps suffering the manipulations of Šālim-āḫum's intermediate accountings.

Šālim-āḫum's operational arrangements with other merchants in this caravan cycle might be understood as an effective approach for a wealthy person in a particular phase of his life. It is possible to see Šālim-āḫum as someone who had no need to build up a significant interpersonal network in Anatolia. With his wealth and potential to invest, Šālim-āḫum could easily attract merchants to represent him in Anatolia when they were available. At the

---

same time, Šalim-āḫum may have required representatives like Pūšu-kēn and the others more intensively when his sons were younger. If this caravan cycle took place before Dān-Aṣšur or Ennam-Aṣšur (one of Šalim-āḫum’s older sons who was also active in the trade) had established significant commercial networks of their own, then their value to Šalim-āḫum as representatives in Anatolia would have been minimal. Without a significant network of contacts in Anatolia, Šalim-āḫum was far more aware of the identities of his transporters than of those who bought his goods in Kaneš. It seems that one productive strategy was for Šalim-āḫum to buy and sell his goods wholesale and avoid too many entanglements in the further operations of the trade on the Anatolian plateau. If so, Šalim-āḫum’s sale to unknown buyers during the caravan cycle suggests that sometimes social distance among Assyrians may have been as important to the function of the trade as family relations.
