The Orbifold Landau-Ginzburg Conjecture for Unimodal and Bimodal Singularities

by

Natalie Bergin

A thesis submitted to the faculty of

Brigham Young University

in partial fulfillment of the requirements for the degree of

Master of Science

Department of Mathematics
Brigham Young University
August 2009
This thesis has been read by each member of the following graduate committee and by majority vote has been found to be satisfactory.

Date

Tyler Jarvis, Chair

Date

Greg Conner

Date

Jessica Purcell
As chair of the candidate’s graduate committee, I have read the thesis of Natalie Bergin in its final form and have found that (1) its format, citations, and bibliographical style are consistent and acceptable and fulfill university and department style requirements; (2) its illustrative materials including figures, tables, and charts are in place; and (3) the final manuscript is satisfactory to the graduate committee and is ready for submission to the university library.

College of Physical and Mathematical Sciences
The Orbifold Landau-Ginzburg Conjecture for Unimodal and Bimodal Singularities

Natalie Bergin
Department of Mathematics
Master of Science

The Orbifold Landau-Ginzburg Mirror Symmetry Conjecture states that for a quasi-homogeneous singularity $W$ and a group $G$ of symmetries of $W$, there is a dual singularity $W^T$ and dual group $G^T$ such that the orbifold A-model of $W/G$ is isomorphic to the orbifold B-model of $W^T/G^T$. The Landau-Ginzburg A-model is the Frobenius algebra $\mathcal{H}_{W,G}$ constructed by Fan, Jarvis, and Ruan, and the B-model is the Orbifold Milnor ring of $W^T$. The unorbifolded conjecture has been verified for Arnol’d’s list of simple, unimodal and bimodal quasi-homogeneous singularities with $G$ the maximal diagonal symmetry group by Priddis, Krawitz, Bergin, Acosta, et al. [9], and by Fan-Shen [4] and Acosta [1] for all two dimensional invertible singularities and by Krawitz for all invertible singularities of 3 dimensions and greater in [8]. Based on this Krawitz posed the Orbifold Landau-Ginzburg Mirror Symmetry Conjecture, where the A-model is still the Frobenius algebra $\mathcal{H}_{W,G}$ constructed by Fan, Jarvis, and Ruan but constructed with respect to a proper subgroup $G$ of the maximal group of symmetries $G_W$ and the B-model is the orbifold Milnor ring of $W^T$ orbifolded with respect to a non-trivial group $K$ in $\text{SL}_n$ of order $[G_W : \langle J \rangle]$. I verify this Orbifold Landau-Ginzburg Mirror Symmetry Conjecture for all unimodal and
bimodal quasi-homogeneous singularities in Arnol’d’s list with $G = \langle J \rangle \lhd G_W$, being the minimal admissible diagonal symmetry group. I also discuss some axioms and properties of these singularities.
ACKNOWLEDGMENTS

Thank you to my professors who shared their help and love of mathematics with me. Thank you to Marc Krawitz for explaining and sharing his work on the orbifold B-model and all who were in my research group. Thank you to my family who have supported me through everything.

1 Introduction

1.1 Background and Motivation

In developing models in string theory, one often comes to a point where one must make an arbitrary choice between two alternatives. The two choices may lead to very different mathematical constructions—usually called an A-model and a B-model, and yet, since the choices are arbitrary, we expect the physics they describe to be the same. That means many of the final mathematical objects that are constructed should be equal, or isomorphic, or otherwise equivalent.

This phenomenon has led to many exciting new discoveries in algebraic and differential geometry. One such discovery is mirror symmetry. There are several types of mirror symmetry, but we are interested in the so-called Berglund-Huebsch mirror symmetry involving Landau-Ginzburg models.

The Landau-Ginzburg B-model is very well understood. Among other things, it takes a quasi-homogeneous polynomial, a polynomial with “weights” for each variable resulting in each term having “weighted” degree 1, with isolated singularities and associates to it the “Chiral ring”, which is simply the Milnor ring $\mathbb{C}[x_1, \ldots, x_n]/\left(\frac{\partial W}{\partial x_i}\right)$ of the singularity $W$.

Until very recently, no one knew how to construct the LG A-model mathematically. But in [5] the LG A-model was finally put on a solid mathematical foundation and many aspects of it were finally understood. Among other things, this A-model associates a ring to each quasi-homogeneous singularity called the FJRW ring. Both this FJRW ring and the (B-model) chiral ring are actually Frobenius algebras.
The general philosophy of mirror symmetry suggests that for a large class of polynomials \( W \), there should be a corresponding mirror polynomial \( W^T \) so that the A-model of one is isomorphic to the B-model of the other. In the case of the B-model chiral ring and the A-model FJRW ring, the obvious conjecture is that for a large class of polynomials \( W \), there is a choice of a mirror dual \( W^T \) so that \( (W^T)^T = W \) and such that there is an isomorphism of Frobenius algebras between the FJRW ring of \( W \) and the chiral ring of \( W^T \). Berglund and Huebsch described a construction of \( W^T \) for certain polynomials that was conjectured to provide the mirror dual.[3]

This conjecture was verified by Acosta in [1], Fan-Shen in [4] and Krawitz in [8]. That is, it was proved that the FJRW ring of \( W \) was isomorphic to the chiral (Milnor) ring of \( W^T \) and conversely. However, one key property of the A-model is that it depends not only on the singularity \( W \) but also on a group of admissible symmetries \( G \). The FJRW ring actually depends heavily on the choice of the group \( G \) and in fact is graded by \( G \).

The conjecture that was proved by Krawitz et al. was for the maximal symmetry group of \( W \) but did not involve any group on the B-side. However, recently an interesting physically motivated construction called “orbifolding” has been developed by Kaufmann and Krawitz for the B-side in [8]. For certain choices of a group of symmetries \( G \) of \( W \), it constructs an orbifolded Chiral ring (orbifolded Milnor ring) which is graded by the group \( G \). If the group is the trivial group, the construction reduces to the usual chiral (Milnor) ring.

Krawitz conjectured that for all the singularities that have an unorbifolded dual \( W^T \) described by Berglund-Huebsch and for all admissible groups \( G \), there should be a dual group \( G^T \) so that the (A-model) FJRW ring for \( W \) and \( G \) is isomorphic as
a Frobenius algebra, to the orbifolded (B-model) Chiral ring for $W^T$ orbifolded by $G^T$.

In this paper I verify this conjecture for all unimodal and bimodal singularities with the minimal admissible group $\langle J \rangle$.

1.2 Overview of Results

In this paper I verify the Orbifold Landau-Ginzburg Mirror Symmetry Conjecture for Arnol’d’s list of unimodal and bimodal singularities where $G = \langle J \rangle < G_W$ [2] based on certain restrictions to the correlators. These singularities are

Unimodal Singularities:

\[
\begin{align*}
P_8 & : x^3 + y^3 + z^3 + axyz \\
X_9 & : x^4 + y^4 + bx^2y^2 \\
Q_{12} & : x^3 + y^5 + yz^2 \\
U_{12} & : x^3 + y^3 + z^4
\end{align*}
\]

Bimodal Singularities:

\[
\begin{align*}
Z_{1,0} & : x^3 y + y^7 \\
Q_{2,0} & : x^3 + xy^4 + yz^2 \\
S_{1,0} & : x^2 z + yz^2 + y^5 \\
U_{16} & : x^3 + xz^2 + y^5 \\
Q_{16} & : x^3 + yz^2 + y^7
\end{align*}
\]
The original “unorbifolded” conjecture was proven for the simple and parabolic singularities in [5] and in [9] for Arnol’d’s list of unimodal and bimodal singularities. As mentioned above, the complete conjecture was later proved by Fan-Shen, Acosta, and Krawitz in [1, 4, 8].

2 Construction

2.1 Review of Construction

For this paper $W$ will always be a non-degenerate, quasi-homogeneous, invertible polynomial in variables $x_1, x_2, \ldots, x_N$.

**Definition 2.1.1.** A quasi-homogeneous polynomial $W$ is a polynomial with weights $q_{x_1}, q_{x_2}, \ldots, q_{x_N}$ in $\mathbb{Q} \cap (0, 1)$ such that any scalar $\lambda \in \mathbb{C}^*$ satisfies

$$W(\lambda^{q_{x_1}}x_1, \lambda^{q_{x_2}}x_2, \ldots, \lambda^{q_{x_N}}x_N) = \lambda W(x_1, x_2, \ldots, x_N).$$

For example, the singularity known as $Q_{2,0}$, defined by the polynomial $x^3 + xy^4 + yz^2$, has weights $q_x = \frac{1}{3}, q_y = \frac{1}{6}, q_z = \frac{5}{12}$.

**Definition 2.1.2.** Non-degeneracy of a quasi-homogeneous polynomial requires that

- the weights be uniquely determined
- there is an isolated singularity at the origin.

Each quasi-homogeneous polynomial $W$ determines a matrix of exponents $B_W$.

**Definition 2.1.3.** The $ij$ entry of the $B_W$ matrix is the exponent of $x_j$ from the $i$-th monomial of the polynomial.
When the number of monomials equals the number of variables, the matrix $B_W$ is square, and because of the non-degeneracy condition, $B_W$ is invertible. In this case, rescaling the variables allows us to assume that all non-zero coefficients are 1, so the matrix completely determines the polynomial up to rescaling. As an example of this matrix representation $W \leftrightarrow B_W$, the singularity $Q_{2,0} : x^3 + xy^4 + yz^2$ has as its corresponding matrix

$$
\begin{pmatrix}
3 & 0 & 0 \\
1 & 4 & 0 \\
0 & 1 & 2
\end{pmatrix}.
$$

**Definition 2.1.4.** When $W$ has the same number of variables as monomials, i.e., when $B_W$ is square, we say that $W$ is *invertible.*

**Remark 2.1.5.** It is known that when the weights are uniquely determined (as in our case), $B_W$ has maximal rank, so $B_W$ is an invertible matrix when it is square.

When $W$ is invertible, the transpose matrix $B_W^T$ corresponds to a different quasi-homogeneous polynomial. This new polynomial will be denoted $W^T$. Often $W^T$ also has an isolated singularity at the origin.

**Remark 2.1.6.** For any invertible singularity, we can rescale the variables so that all non-zero coefficients are 1. Throughout this paper we will always make this rescaling.

**Definition 2.1.7.** For any invertible singularity $W$, the Berglund-Huebsch dual $W^T$ is defined to be the polynomial with monomials determined by $B^T$ (and with all non-zero coefficients equal to 1).

For example, $Q_{1,0}$ gives

$$
B_{Q_{2,0}}^T = \begin{pmatrix}
3 & 0 & 0 \\
1 & 4 & 0 \\
0 & 1 & 2
\end{pmatrix}^T = \begin{pmatrix}
3 & 1 & 0 \\
0 & 4 & 1 \\
0 & 0 & 2
\end{pmatrix}.$$
thus $Q^T_{2,0} : x^3y + y^4z + z^2$.

We need the Jacobean ideal to define both the A-model and the B-model rings.

**Definition 2.1.8.** The Jacobian ideal $\mathcal{J}$ is defined by

$$\mathcal{J} = \left( \frac{\partial W}{\partial x_1}, \frac{\partial W}{\partial x_2}, \ldots, \frac{\partial W}{\partial x_N} \right).$$

**Definition 2.1.9.** The Hessian of $W$ is defined by

$$\text{hess}(W) = \det \left( \frac{\partial^2 W}{\partial x_i \partial x_j} \right).$$

**Definition 2.1.10.** The Milnor ring $\mathcal{Q}_W$ of $W$, is defined to be

$$\mathcal{Q}_W := \mathbb{C}[x_1, x_2, \ldots, x_N]/\mathcal{J}.$$$$\mathcal{Q}_W$$ is finite dimensional as a vector space over $\mathbb{C}$ and the dimension as seen in [2] is

$$\mu = \prod_{j=1}^{N} \left( \frac{1}{q_j} - 1 \right).$$

This ring $\mathcal{Q}_W$ is graded by weighted degree. The elements of the top degree form a one-dimensional subspace generated by $\text{hess}(W)$. [9]

$\mathcal{Q}_W$ has a residue pairing $\langle f, g \rangle$ defined by

$$fg = \frac{\langle f, g \rangle}{\mu} \text{hess}(W) + \text{lower order terms}.$$ for $f, g \in \mathcal{Q}_W$.

For $Q_{2,0}$ we see $\mathcal{J} = (3x^2 + y^4, 4xy^3 + z^2, 2yz)$ and so

$$\mathcal{Q}_{Q_{2,0}} = \mathbb{C}[x, y]/\mathcal{J} = \langle 1, x, x^2, y, y^2, y^3, z, z^2, xy, xy^2, x^2y, x^2y^2, xz, xz^2 \rangle.$$
**Definition 2.1.11.** A Frobenius algebra is an algebra with a non-degenerate pairing $\langle , \rangle$ with the property that for all $\alpha, \beta, \gamma$ elements of the algebra we have $\langle \alpha \beta, \gamma \rangle = \langle \alpha, \beta \gamma \rangle$.

The Milnor ring with its residue pairing forms a graded Frobenius algebra.[9]

We will now define the construction of the (A-model) FJRW ring. To do this, we first need to choose an admissible group of diagonal symmetries. The choice of group determines the structure of the FJRW ring.

**Definition 2.1.12.** The maximal group of diagonal symmetries is given by

$$G_W = \{ (\alpha_1, \alpha_2, \ldots, \alpha_N) \subseteq (\mathbb{C}^*)^N \mid W(\alpha_1 x_1, \alpha_2 x_2, \ldots, \alpha_N x_N) = W(x_1, x_2, \ldots, x_N) \}.$$

**Definition 2.1.13.** For a quasi-homogeneous polynomial with weights $\{q_x\}$, the exponential grading element is $J = (e^{2\pi i q_{x_1}}, e^{2\pi i q_{x_2}}, \ldots, e^{2\pi i q_{x_N}})$.

$G_W$ always contains the exponential grading element. In [9] the maximal symmetry group $G_W$ was always used and corresponds on the B-side to the trivial group (the “unorbifolded” case). It is known that the group $\langle J \rangle$ is always admissible [5]. The computations in this paper always will use the cyclic group $\langle J \rangle$ generated by the exponential grading element.

Recall Krawitz conjectured that for all the singularities that have an unorbifolded dual $W^T$ described by Berglund-Huebsch and for all admissible groups $G$, there should be a dual group $G^T$ so that the (A-model) FJRW ring for $W$ and $G$ is isomorphic as a Frobenius algebra, to the orbifolded (B-model) Milnor ring.

**Definition 2.1.14.** For $h \in G$, $\text{Fix} \ h \subset \mathbb{C}^N$ is the fixed locus of $h$. The dimension of this fixed locus will be denoted as $N_h$. 

7
Definition 2.1.15. For any admissible group $G$ and for each $h \in G$ we define

$$\mathcal{H}_h := \mathcal{Z}_W|_{\text{Fix}_h} \cdot \omega$$

where $\omega = dx_{i_1} \wedge dx_{i_2} \wedge \cdots \wedge dx_{i_{N_h}}$ is the natural choice of volume form.

Note: The FJRW construction uses middle-dimensional relative homology of a Milnor fibration, but that construction is isomorphic to this one.

Definition 2.1.16. Choose a cyclic admissible group $G \leq G_W$ with generator $a$. If $\text{Fix}(a^k) = \{0\}$ then we define

$$e_k = 1 \in \mathcal{H}_{a^k} \cong \mathbb{C},$$

and if $\text{Fix} a^k = \mathbb{C}x_{i_1} \oplus \cdots \oplus \mathbb{C}x_{i_{N_a}}$ define

$$e_k = dx_{i_1} \wedge dx_{i_2} \wedge \cdots \wedge dx_{i_{N_a}} \in \mathcal{H}_{y^k}.$$ 

Note that for $a = J$ we have $\text{Fix}(J^1) = \{0\}.$

Consider $Q_{2,0}$ again where $G = \langle J \rangle = \left\langle \left\langle e^{2\pi i \frac{1}{4}}, e^{2\pi i \frac{1}{6}}, e^{2\pi i \frac{1}{12}} \right\rangle \right\rangle.$

$$\mathcal{H}_{J^k} = \begin{cases} 
\langle e_0, xe_0, x^2e_0, ye_0, y^2e_0, z^2e_0, xye_0, xy^2e_0, x^2y^2e_0, xze_0, xz^2e_0 \rangle & k = 0 \\
\langle e_6, xe_6, x^2e_6, ye_6, y^2e_6, y^3e_6, xy_6, xy^2e_6, x^2y_6, x^2y^2e_6 \rangle & k = 6 \\
\langle e_k, xe_k \rangle & k = 3, 9 \\
\langle e_k \rangle & \text{otherwise.} 
\end{cases}$$

The group $G$ acts on $\mathcal{H}_h$ by acting on the coordinates. We define the $h$-sector $\mathcal{H}_h^G$ to be the vector space of $G$-invariants of $\mathcal{H}_h$. The underlying vector space, often called
the state space, of the FJRW-ring is defined to be

$$\mathcal{H}_{W,G} := \left( \bigoplus_{h \in G} \mathcal{H}_h \right)^G.$$  

For $Q_{2,0}$ this vector space is $\mathcal{H}_{Q_{2,0},(r)} = \langle e_1, e_2, e_4, e_5, y^3 e_6, xy e_6, e_7, e_8, e_{10}, e_{11} \rangle$.

**Definition 2.1.17.** For each $h \in G$ we define $\Theta_h^i \in \mathbb{Q} \cap [0,1)$ by the fact that $h$ can be uniquely expressed as

$$h = (e^{2\pi i \Theta_h^1}, e^{2\pi i \Theta_h^2}, \ldots, e^{2\pi i \Theta_h^N})$$

Having considered $\Theta$ we can now talk about the $W$-degree of an element.

**Definition 2.1.18.** For any $h \in G$ and and $\alpha_h$ in the $h$-sector $H^G_h$, the $W$-degree of $\alpha_h$ is defined by

$$\deg_W(\alpha_h) := N_h + 2 \sum_{j=1}^{N} (\Theta_h^j - q_j)$$

when $\alpha_h \in (\mathcal{H}_h)^G$.

The space $\mathcal{H}_{W,G}$ is a complex vector space that is $\mathbb{Q}$-graded by this $W$-degree. Clearly the $W$-degree only depends on the $G$-grading.

Now we wish to define a pairing on the state space $\mathcal{H}_{W,G}$. To do this, note first that we have an isomorphism $I : \mathcal{H}_h \rightarrow \mathcal{H}_{h-1}$.

**Definition 2.1.19.** Define a pairing on $\mathcal{H}_h^G \otimes H^G_{h-1}$ by $\langle \alpha, I^{-1}(\beta) \rangle$ for $\alpha \in \mathcal{H}_h^G$ and $\beta \in \mathcal{H}_{h-1}^G$, and extend the pairing linearly to all of $H_{W,G}$. It can be shown that this pairing is non-degenerate on $\mathcal{H}_{W,G}$.

For a given choice of basis we denote by $\eta_{\alpha,\beta}$ the matrix representation of the pairing and by $\eta^{\alpha,\beta}$ the inverse of that matrix.
The multiplication for the Frobenius algebra is determined by the FJRW cohomological field theory.\cite{5} This field theory produces classes $\Lambda_{g,n}^W(\alpha_1, \alpha_2, \ldots, \alpha_n) \in H^*(\overline{\mathcal{M}}_{g,n})$ where $\overline{\mathcal{M}}_{g,n}$ is the stack of stable curves of genus $g$ with $n$ marked points. The classes $\Lambda_{g,n}^W$ have complex codimension $D$ for each $n$-tuple $(\alpha_1, \alpha_2, \ldots, \alpha_n) \in (\mathcal{H}_{W,G})^n$ where

$$D := \hat{c}_W(g-1) + \frac{1}{2} \sum_{i=1}^{n} \deg_W(\alpha_i)$$

and where

$$\hat{c}_W := \sum_i (1 - 2q_{x_i})$$

We do not need the entire cohomological field theory to define the FJRW ring, but we can use the genus-zero, three-point classes to define \textit{correlators} which will determine the structure constants of the algebra.

\textbf{Definition 2.1.20.} We define the three-point correlators as follows:

$$\langle \alpha_1, \alpha_2, \alpha_3 \rangle_0^W := \int_{\mathcal{M}_{0,3}} \Lambda_{0,3}^W(\alpha_1, \alpha_2, \alpha_3).$$

It is easy to see that $\langle \alpha_1, \alpha_2, \alpha_3 \rangle$ is nonzero only when its codimension $D$ is zero because $\overline{\mathcal{M}}_{0,3}$ is a point.

When $g = 0$ and $n = 3$, then $D = 0$ if and only if $\sum_{i=1}^{3} \deg_W \alpha_i = 2\hat{c}_W$.

The ring structure is given by these three-point correlators. Given $r, s \in \mathcal{H}_{W,G}$, their product is defined to be

$$r \ast s := \sum_{\alpha, \beta} \langle r, s, \alpha \rangle \eta^{\alpha, \beta} \beta$$

where the sum is taken over all choices of $\alpha$ and $\beta$ in a fixed basis of $\mathcal{H}_{W,G}$\cite{5}

In [5] it is proved that the classes $\Lambda_{g,n}^W$ satisfy certain axioms that facilitate their computation. Below we provide a simplified form of these axioms that applies in the
cases that we need to compute.

**Axiom 1. Dimension:** If \( D \not\in \frac{1}{2} \mathbb{Z} \), then \( \Lambda_{g,n}^W(\alpha_1, \alpha_2, \ldots, \alpha_n) = 0 \). Otherwise, \( D \) is the complex codimension of the class \( \Lambda_{g,n}^W(\alpha_1, \alpha_2, \ldots, \alpha_n) \). In particular, if \( g = 0 \) and \( n = 3 \), then \( \langle \alpha_1, \alpha_2, \alpha_3 \rangle = 0 \) unless \( D = 0 \).

**Axiom 2. Symmetry:** Let \( \sigma \in S_3 \). Then

\[
\langle \alpha_1, \alpha_2, \alpha_3 \rangle = \langle \alpha_{\sigma(1)}, \alpha_{\sigma(2)}, \alpha_{\sigma(3)} \rangle
\]

The next few axioms rely on the degrees of line bundles \( \mathcal{L}_1, \ldots, \mathcal{L}_N \) endowing an orbicurve with a so-called \( W \)-structure; however, this can be reduced to a simple numerical criterion. Consider the class \( \Lambda_{g,n}^W(\alpha_1, \alpha_2, \ldots, \alpha_k) \), with \( \alpha_j \in (\mathcal{H}_j)^G \) for each \( j \). For each variable \( x_j \), define \( l_j \) by

\[
l_j = q_j(2g - 2 + k) - \sum_{i=1}^{k} \Theta_{j}^{h_i}
\]

**Axiom 3. Integer degrees:** If \( l_j \not\in \mathbb{Z} \) for some \( j \in \{1, \ldots, N\} \), then \( \Lambda_{g,n}^W(\alpha_1, \alpha_2, \ldots, \alpha_n) = 0 \).

**Axiom 4. Concavity:** If \( l_j < 0 \) for all \( j \in \{1,2,3\} \), then \( \langle \alpha_1, \alpha_2, \alpha_3 \rangle = 1 \).

The next axiom is related to the Witten map:

\[
\mathcal{W} : \bigoplus_{j=1}^{N} \mathbb{C}^{h_0_j} \to \bigoplus_{j=1}^{N} \mathbb{C}^{h_1_j}
\]

\[
\mathcal{W} = \left( \frac{\partial W}{\partial x_1}, \frac{\partial W}{\partial x_2}, \ldots, \frac{\partial W}{\partial x_N} \right)
\]

where \( h_0_j \) and \( h_1_j \) are defined by

\[
h_0_j := \begin{cases} 
0 & \text{if } l_j < 0 \\
l_j + 1 & \text{if } l_j \geq 0
\end{cases}
\]
so that both are non-negative integers satisfying \( h_j^0 - h_j^1 = l_j + 1 \). The fact that the Witten map is well-defined is a consequence of the geometric conditions on the \( \mathcal{L}_j \) considered in [5]. For further details, we refer readers to the original paper.

In \( \mathcal{M}_{g,n} \), if \( \Lambda^W_{g,n}(\alpha_1, \alpha_2, \ldots, \alpha_n) \) is a class of codimension zero, then these classes are constant and so, abusing notation, we will simply consider \( \Lambda^W_{g,n}(\alpha_1, \alpha_2, \ldots, \alpha_n) \) to be a complex number. We will use this convention through the rest of the thesis.

**Axiom 5. Index Zero:** Consider the class \( \Lambda^W_{g,n}(\alpha_1, \alpha_2, \ldots, \alpha_n) \), with \( \alpha_i \in H_{\gamma_i,G} \). If \( \text{Fix} \gamma_i = \{0\} \) for each \( i \in \{1, 2, \ldots, n\} \) and

\[
\sum_{j=1}^N (h_j^0 - h_j^1) = 0,
\]

then \( \Lambda_{g,n}(\alpha_1, \alpha_2, \ldots, \alpha_n) \) is of codimension zero, and \( \Lambda^W_{g,n}(\alpha_1, \alpha_2, \ldots, \alpha_n) \) is equal to the degree of the Witten map.

**Axiom 6. Composition:** If the four-point class \( \Lambda^W_{g,n}(\alpha_1, \alpha_2, \alpha_3, \alpha_4) \) is of codimension zero, then it decomposes as sums of three-point correlators in the following way:

\[
\Lambda^W_{0,4}(\alpha_1, \alpha_2, \alpha_3, \alpha_4) = \sum_{\beta, \delta} \langle \alpha_1, \alpha_2, \beta \rangle \eta^{\beta,\delta} \langle \delta, \alpha_3, \alpha_4 \rangle = \sum_{\beta, \delta} \langle \alpha_1, \alpha_3, \beta \rangle \eta^{\beta,\delta} \langle \delta, \alpha_2, \alpha_4 \rangle.
\]

Note that \( \text{Fix} J = \{0\} \) so \( \mathcal{H}_f \cong \mathbb{C} \). Let \( 1 \) be the element in \( \mathcal{H}_f \) corresponding to \( 1 \in \mathbb{C} \). This element has \( \text{deg}_{W}(1) = 0 \) and it turns out to be the identity element in the FJRW-ring. The next axiom deals with this element.

**Axiom 7. Pairing:** For \( \alpha_1, \alpha_2 \in \mathcal{H}_{W,G} \), \( \langle \alpha_1, \alpha_2, 1 \rangle = \eta_{\alpha_1, \alpha_2} \).
Axiom 8. Sums of singularities: If $W_1 \in \mathbb{C}[x_1, \ldots, x_r]$ and $W_2 \in \mathbb{C}[y_1, \ldots, y_s]$ are two non-degenerate, quasi-homogeneous polynomials with maximal symmetry groups $G_1$ and $G_2$, then the maximal symmetry group of $W = W_1 + W_2$ is $G = G_1 \times G_2$, and there is an isomorphism of Frobenius algebras

$$\mathcal{H}_{W,G} \cong \mathcal{H}_{W_1,G_{W_1}} \otimes \mathcal{H}_{W_2,G_{W_2}}$$

2.2 Orbifolded B-model construction

In the original “unorbifolded” Landau-Ginzburg conjecture the B-model of a singularity $W$ is simply the Milnor ring of $W$, that is $\mathbb{C}[x_1, \ldots, x_n]/(\partial W/\partial x_i)$. This Milnor ring is the same as orbifolding by the trivial group. Orbifolding for the B-models is a very similar construction for the FJRW-ring of the A-model. First we must choose a group $K$ such that $K < G_W \cap \text{SL}_n$ and find the fixed locus of every element in $K$. Restricting $W$ to each fixed locus we can find the Milnor ring of that restriction. Using the same $K$-action as in the A-model, one may compute invariants of each of these restricted Milnor rings and sum these sectors over all the elements in $K$. This will give us the underlying vector space of the B-model orbifolded chiral ring, but we still need to define the multiplication in this new algebra.

2.2.1 Orbifold B-side multiplication

As discussed earlier, although the B-side as a vector space has been around for some time, its structure as a ring has only recently been developed. This section describes the B-side multiplication which was investigated in general by Kaufmann [6] and explicitly written out by Marc Krawitz in [8].

The underlying vector space of the Landau-Ginzburg orbifold B-model of $W/G$ is defined to be
\[ Q = \bigoplus_{g \in K} Q_g \]

where \( Q \) is a \( G \)-graded \( \mathbb{C} \)-vector space.

Now we are ready to define the multiplication on the B-model orbifolded chiral ring.

**Definition 2.2.1.** For \( g \in K \), let \( I_g = \{ i \mid g_i = 1 \} \) and when let \( N_g := \dim(\text{Fix}(g)) \).

\[
\gamma_{g,h} \frac{\text{Hess}W|_{\text{Fix}(g) \cap \text{Fix}(h)}}{\dim(\text{Fix}(g) \cap \text{Fix}(h))} = \begin{cases} 
\text{Hess}W|_{\text{Fix}(gh)} \quad &\text{If } I_g \cup I_h \cup I_{gh} = \{1, 2, \ldots, n\} \\
0 &\text{otherwise.} 
\end{cases}
\]

where \( \frac{\text{Hess}}{\dim} := 1 \) if \( \text{Fix} = 0 \).

So \( \gamma_{g,h} \) is given by the determinant of the hessian of \( W \) on the newly fixed locus, provided each variable is fixed by at least one of \( g, h \) and \( gh \). If \( g = \text{id} \) or \( h = \text{id} \) the newly fixed locus is empty then by convention the determinant of the empty \((0 \times 0)\) matrix is 0.

Let \( b_g \) denote the element 1 in the milnor ring \( Q_g \).

**Definition 2.2.2.** We define the multiplication of the elements \( b_g \) and \( b_h \in Q \) by \( b_g \ast b_h = \gamma_{g,h} b_{gh} \) and extend to the rest of \( Q \) in the obvious way.

Note that if \( e \in K \) is the identity in \( K \) then \( b_e \) is the multiplicative identity for this multiplication. This follows from the fact that \( \gamma_{e,g} = 1 = \gamma_{g,e} \).

This multiplication is associative, which was proved by Kaufmann in [6]-[7]. It suffices to check \( \gamma_{g,h} \gamma_{gh,k} = \gamma_{g,hk} \gamma_{h,k} \).

The orbifolded Milnor ring of \( Q_{2,0}^T : x^3y + y^4z + z^2 \) is

\[ \langle b_0, zb_0, x^2b_0, y^2b_0, xyb_0, y^2zb_0, xy^2b_0, xyzb_0, xy^2zb_0, b_1 \rangle \]

As an example of this multiplication where \( \langle J \rangle^T = \langle (\alpha, \alpha, 1) \rangle \) when \( \alpha^2 = 1 \) consider
\[ b_1 \ast b_1 = \gamma_{1,1} b_0 \text{ where} \]

\[
\frac{\text{Hess}_{Q_{2,0}\mid \text{Fix}((a,a,1))}}{\text{dim}(\text{Fix}((a,a,1) \cap \text{Fix}((a,a,1))))} \quad = \quad \frac{\text{Hess}_{Q_{2,0}\mid \text{Fix}((a,a,1)(a,a,1))}}{\text{dim}(\text{Fix}((a,a,1)(a,a,1))))}
\]

\[
\frac{\text{Hess}_{Q_{2,0}\mid c_z}}{\text{dim}(c_z \cap c_z)} \quad = \quad \frac{3}{408xy^3z}
\]

\[
\gamma_{1,2} = \frac{3}{204xy^3z}
\]

\[
\gamma_{1,1} = \frac{204xy^3z}{3}
\]

So \( b_1 \ast b_1 = \gamma_{1,1} b_0 = \frac{204}{3} xy^3 z b_0 \).

### 2.3 Additional Notation

This paper discusses the Orbifold Landau-Ginzburg mirror symmetry conjecture for the invertible unimodal and bimodal singularities where the A side is orbifolded by \( G = \langle J \rangle \) and the B side is orbifolded by \( G^T \cap \text{SL}_n \), where \( |G^T| = [G_W : \langle J \rangle] \).

**Definition 2.3.1.** A loop and a chain are polynomials defined as

\[
W_{\text{loop}} := x_1^{a_1} x_2 + x_2^{a_2} x_3 + \cdots + x_n^{a_n} x_1
\]

\[
W_{\text{chain}} := x_1^{a_1} x_2 + x_2^{a_2} x_3 + \cdots + x_n^{a_n}
\]

**Definition 2.3.2.** A singularity is irreducible if the polynomial associated to it is a loop or a chain.

**Proposition 2.3.3.** The maximal symmetry group \( G_W \) is cyclic when \( W \) is an irreducible quasi-homogeneous invertible non-degenerate singularity.
Proof. Since the singularity is irreducible it must either be a loop or a chain. Notice that the only difference between the loop and the chain is the last term.

Choose a \((\beta_1, \beta_2, \ldots, \beta_n) \in G_W\). By definition of \(G_W\) we have

\[ W(\beta_1 x_1, \beta_2 x_2, \ldots, \beta_n x_n) = W(x_1, x_2, \ldots, x_n). \]

Therefore \(\beta_i^{a_i} \beta_{i+1} = 1\) for every \(1 \leq i \leq n - 1\). Using this we can get each \(\beta_i\) entirely in terms of \(\beta_1\) by

\[ \beta_i = \beta_1^{\prod_{k=1}^{n-1} (-1)^{i-a_k}}. \]

So \((\beta_1, \beta_2, \ldots, \beta_n) = \left(\beta_1, \beta_1^{-a_1}, \beta_1^{a_1 a_2}, \ldots, \beta_1^{\prod_{k=1}^{n-1} (-1)^{a_k}}\right)\).

For a loop \(\beta_1 \in \mathbb{C}^*\) has order that divides \(|1 + (-1)^{n-1} \prod_{k=1}^{n} a_k|\).

For a chain \(\beta_1 \in \mathbb{C}^*\) has order that divides \(\prod_{k=1}^{n} a_k\).

Let \(\alpha_1 \in \mathbb{C}^*\) have order \(|1 + (-1)^{n-1} \prod_{k=1}^{n} a_k|\) for a loop and have order \(\prod_{k=1}^{n} a_k\) for a chain. Clearly \(\left(\alpha_1, \alpha_1^{-a_1}, \alpha_1^{a_1 a_2}, \ldots, \alpha_1^{\prod_{k=1}^{n-1} (-1)^{a_k}}\right)\) is an element of \(G_W\).

We can see that \(\beta_1\) would have to be some power \(q\) of \(\alpha_1\), giving

\[
(\beta_1, \beta_2, \ldots, \beta_n) = \left(\beta_1, \beta_1^{-a_1}, \beta_1^{a_1 a_2}, \ldots, \beta_1^{\prod_{k=1}^{n-1} (-1)^{a_k}}\right)
\]

\[
= \left(\alpha_1^q, (\alpha_1^q)^{-a_1}, (\alpha_1^q)^{a_1 a_2}, \ldots, (\alpha_1^q)^{\prod_{k=1}^{n-1} (-1)^{a_k}}\right)
\]

\[
= \left(\alpha_1^q, (\alpha_1^{-a_1})^q, (\alpha_1^{a_1 a_2})^q, \ldots, (\alpha_1^{\prod_{k=1}^{n-1} (-1)^{a_k}})^q\right)
\]

\[
= \left(\alpha_1, \alpha_1^{-a_1}, \alpha_1^{a_1 a_2}, \ldots, \alpha_1^{\prod_{k=1}^{n-1} (-1)^{a_k}}\right)^q.
\]

Therefore \(G_W\) is cyclic with \(\left(\alpha_1, \alpha_1^{-a_1}, \alpha_1^{a_1 a_2}, \ldots, \alpha_1^{\prod_{k=1}^{n-1} (-1)^{a_k}}\right)\) as a generator. 

There are many non-degenerate invertible singularities that are reducible. These singularities are sums of loops and chains. \(G_W\) is a product of the cyclic groups for these loops and chains by axiom 8.
2.3.1 Orbifold Example $Q_{2,0}$

The charges for $Q_{2,0} = x^3 + xy^4 + yz^2$ are $q_x = \frac{1}{3}$, $q_y = \frac{1}{6}$, $q_z = \frac{5}{12}$. Therefore

$$\langle J \rangle = \left\langle \left( e^{\frac{2\pi i}{3}}, e^{\frac{2\pi i}{6}}, e^{\frac{10\pi i}{12}} \right) \right\rangle \cong \mathbb{Z}_{12}$$

For the orbifold B-side we will need to know the index of $\langle J \rangle$ in the maximal symmetry group of $Q_{2,0}$. In order to find the maximal symmetry group we consider $G_{Q_{2,0}} = \langle (\alpha, \beta, \gamma) \rangle$ such that $(\alpha x)^3 + (\alpha x)(\beta y)^4 + (\beta y)(\gamma z)^2 = x^3 + xy^4 + yz^2$. Thus we have $\alpha^3 = \alpha^4 = \beta^2 = 1$ and $G_{Q_{2,0}} = \langle (\gamma^8, \gamma^{-2}, \gamma) \rangle \cong \mathbb{Z}_{24}$ when $\gamma^{24} = 1$

In order to find the fixed locus of $J^k$ we consider what variables are fixed for $k \in \mathbb{Z}_{24} = \{0, 1, 2 \ldots, 23\}$. Everything will be fixed for $k = 0$ since $J^0 = (1, 1, 1)$. When $k = 6$ we have $J^6 = (1, 1, e^{5\pi i})$, so only the $x$ and $y$ values are fixed. Following this pattern for all values of $k$ we get the following fixed locus

$$\text{Fix} J^k = \begin{cases} \mathbb{C}^3 & k = 0 \\ \mathbb{C}^2_{xy} & k = 6 \\ \mathbb{C}_x & k = 3, 9 \\ 0 & \text{otherwise.} \end{cases}$$

Restricting $Q_{2,0}$ to the fixed locus gives us

$$Q_{2,0}|_{\text{Fix} J^k} = \begin{cases} x^3 + xy^4 + yz^2 & k = 0 \\ x^3 + xy^4 & k = 6 \\ x^3 & k = 3, 9 \\ 0 & \text{otherwise.} \end{cases}$$

and thus the Milnor rings for these values of $k$ gives
\[ Q_{\text{Fix}J^k} = \begin{cases} 
\langle 1, x, x^2, y, y^2, y^3, z, \dot{x}, \dot{y}, xy, xy^2, x^2y^2, xz, xz^2 \rangle & k = 0 \\
\langle 1, x, x^2, y, y^2, y^3, \dot{x}, \dot{y}, \dot{z}, \dot{x}y, \dot{y}^2, x^2y^2, xz, xz^2 \rangle & k = 6 \\
\langle 1, x \rangle & k = 3, 9 \\
\langle 1 \rangle & \text{otherwise.} 
\end{cases} \]

In order to find \( \langle J \rangle \) invariants we consider \( x^i y^j z^k dx \wedge dy \wedge dz \). This element is invariant if and only if \( \frac{i}{3} + \frac{j}{6} + \frac{5k}{12} + \frac{1}{3} + \frac{1}{6} + \frac{5}{12} = 0 \mod 1 \). Similarly the element \( x^i y^j dx \wedge dy \) is invariant if and only if \( \frac{i}{3} + \frac{j}{6} + \frac{1}{3} + \frac{1}{6} = 0 \mod 1 \). So from the sector \( k = 6 \) we get the invariants \( y^3e_6 \) and \( xye_6 \). The element 1 in each \( k \) sector will be expressed as \( e_k \).

For the sectors \( k = 0, 3, 9 \) there are no invariant elements. For all other \( k \)-sectors the only invariant element is \( e_k \). Thus this gives us our table of elements.

</tbody>
</table>

Table 1: \( Q_{2,0} \) example for table of A side elements.

The only nonzero correlators by Axiom 1 are these the following.

Concavity axiom:
\[ \langle e_1, e_1, e_{11} \rangle, \langle e_1, e_7, e_5 \rangle, \langle e_1, e_8, e_4 \rangle, \langle e_1, e_{10}, e_2 \rangle, \langle e_{10}, e_8, e_7 \rangle, \langle e, e, e \rangle \text{ all equal 1}. \]

Pairing axiom:
\[ \langle e_1, y^3e_6, y^3e_6 \rangle = -\frac{1}{4} \]
\[ \langle e_1, xye_6, xye_6 \rangle = \frac{1}{12} \]

Index zero axiom:
\[ \langle e_{10}, e_{10}, e_5 \rangle = -2 \]
Thus using these correlators we can compute all of the multiplication for this ring.

Since \( e_1 = 1 \) is the identity in the ring multiplication with \( e_1 \) is trivial. The upper-half multiplication table is given as

\[
\begin{array}{|cccccccccc|}
\hline
 & e_1 & e_{10} & e_8 & e_7 & e_{y6} & y^3e_6 & e_5 & e_4 & e_2 & e_{11} \\
\hline
 e_1 & e_1 & e_{10} & e_8 & e_7 & e_{y6} & y^3e_6 & e_5 & e_4 & e_2 & e_{11} \\
e_{10} & -2e_7 & e_5 & e_4 & 0 & 0 & -2e_2 & 0 & e_{11} & 0 & 0 \\
e_8 & 0 & e_2 & 0 & 0 & 0 & e_{11} & 0 & 0 & 0 \\
e_7 & 0 & 0 & 0 & e_{11} & 0 & 0 & 0 & 0 \\
x_ye_6 & \frac{1}{12}e_{11} & 0 & 0 & 0 & 0 & 0 \\
y^3e_6 & -\frac{1}{2}e_{11} & 0 & 0 & 0 & 0 & 0 \\
e_5 & 0 & 0 & 0 & 0 \\
e_4 & 0 & 0 & 0 \\
e_2 & 0 \\
e_{11} & 0 \\
\hline
\end{array}
\]

Table 2: \( Q_{2,0} \) example for multiplication table of A side elements.

Now we will construct the Orbifold B side. We can easily see that \( Q_{2,0}^T = x^3y+y^4z+z^2 \) and its maximal symmetry group is also \( G_{Q_{2,0}}^T = \langle (\alpha, \alpha^{-3}, \alpha^{12}) \rangle \cong \mathbb{Z}_{24} \) where \( \alpha^{24} = 1 \).

The group \( K \) by which the B side is orbifolded must be of order \([G_W : \langle J \rangle]\) in \( G_{W}^T \) and also in \( \text{SL}_3(\mathbb{C}) \). Since \( G_{Q_{2,0}} \cong \mathbb{Z}_{24} \) and \( \langle J \rangle \cong \mathbb{Z}_{12} \), \( [G_{Q_{2,0}} : \langle J \rangle] = 2 \). Therefore one such \( K \) is \( K = \langle (\alpha^{12}, \alpha^{12}, 1) \rangle = \langle (\beta, \beta, 1) \rangle \) where \( \beta^2 = 1 \). For notational ease we denote \( K \) as \( K = \langle m \rangle \).

Computing the fixed and Milnor ring locus in a similar way as before we get

\[
\text{Fix}m^k = \begin{cases} 
\mathbb{C}^2 & k = 0 \\
0 & \text{otherwise.}
\end{cases}
\]

\[
Q|_{\text{Fix}m^k} = \begin{cases} 
\langle 1, x, x^2, y, y^2, y^3, z, xy, xy^2, xy^3, xz, yz, y^2z, y^3z, xyz, x^2y, x^2z, xy^3z \rangle & k = 0 \\
\langle 1 \rangle & \text{otherwise.}
\end{cases}
\]

Also computing \( K \)-invariance we get the following elements in Table 3 to be invariant.
Let $b_k$ represent the element 1 in the respective $k$ sector.

Now for the B side multiplication, since $b_0$ is the identity in the ring its multiplication is trivial. In the Orbifold B-model multiplication section we already walked through a multiplication example for $Q^{T}_{2,0}$. Following this same process for all pairs we get

<table>

</table>

Now the FJRW ring for $Q_{2,0}$ and the orbifold ring for $Q^{T}_{2,0}$ are isomorphic as vector spaces just by sharing the same dimension and corresponding degrees. Therefore if they were to have the same multiplication table that would be enough to prove they are isomorphic as rings. So instead of having $b_1$ and $x^2b_0$ as elements we can scale them to be $\frac{1}{4\sqrt{51}}b_1$ and $\frac{1}{4}x^2b_0$ giving the upper half of the multiplication table as seen
in Table 4.

Table 4: $Q_{2,0}$ example for multiplication table of B side elements.

Since the FJRW ring A model multiplication table and the Chiral ring B-model multiplication table match exactly the rings are isomorphic.

### 2.4 Format of results

For each singularity, the information will be displayed in the following pattern:

- The name of the singularity will be given and also the polynomial that defines it, the Jacobian ideal, the weights associated to each variable, and the central charge. Also given will be the symmetry group used in the construction, $\langle J \rangle$.

- The fixed locus will be described for each group element.

- A basis for the Milnor ring of $W$ restricted to each fixed locus will be given.

- Sectors with non-trivial $J$-invariants will be displayed in a table including the invariant elements and their $W$-degrees.

- Values of the three-point correlators that are not required to vanish by Axioms 1 and 2 will be given. There are some correlators that cannot be computed
from the axioms alone. These will be given variable labels.

- Multiplication table for both the A-side and B-side singularities will be given. For many singularities a system of equations will be shown in order to match these multiplication tables for an isomorphism. The solution to the systems will be given.

3 Computations

The examples are taken from the unimodal and bimodal singularities listed by Arnol’d. Many of these singularities are quasi-homogeneous only after fixing specific parameter values. This will be done without further comment.

3.1 Unimodal singularities

3.1.1 $P_8$

$P_8$ is normally the singularity $x^3 + y^3 + z^3 + axyz$ however this is not invertible. We will continue for the case where $a = 0$ making $P_8$ invertible.

A model: $P_8 : x^3 + y^3 + z^3$

$$J = \langle 3x^2, 3y^2, 3z^2 \rangle$$

$$q_x = \frac{1}{3}, q_y = \frac{1}{3}, q_z = \frac{1}{3}$$

$$G_{P_8} = \langle (\alpha, \beta, \gamma) \rangle \cong \mathbb{Z}_3 \times \mathbb{Z}_3 \times \mathbb{Z}_3$$ when $\alpha^3 = \beta^3 = \gamma^3$

$$\text{Fix}. J^k = \begin{cases} \mathbb{C}^3 & k = 0 \\ 0 & \text{otherwise.} \end{cases}$$
\[
Q|_{\text{Fix}J^s} = \begin{cases}
\langle 1, x, y, z, xy, xz, yz, xyz \rangle & k = 0 \\
\langle 1 \rangle & \text{otherwise.}
\end{cases}
\]

\hline
\end{array}
\]

Table 11: $X_9$ B side elements.
Table 12: \( X_9 \) B side multiplication.

### 3.1.3 \( Q_{12} \)

A model: \( Q_{12} : x^3 + y^5 + yz^2 \)

\[ \mathcal{J} = \langle 3x^2, 5y^4 + z^2, 2yz \rangle \]

\[ q_x = \frac{1}{3}, q_y = \frac{1}{5}, q_z = \frac{2}{5} \]

\[ G_{Q_{12}} = \langle (\alpha, \gamma^{-2}, \gamma) \rangle \cong \mathbb{Z}_{30} \text{ when } \alpha^3 = \gamma^{10} = 1 \]

\[ \text{Fix}_{\mathcal{J}^k} = \begin{cases} 
\mathbb{C}^3 & k = 0 \\
\mathbb{C}_x & 3|k \\
\mathbb{C}_y^2 & 5|k \\
0 & \text{otherwise.} 
\end{cases} \]

\[ Q|_{\text{Fix}_{\mathcal{J}^k}} = \begin{cases} 
\langle 1, x, y, y^2, y^3, y^4, z, xy, xy^2, xy^3, xy^4, xz \rangle & k = 0 \\
\langle 1, x \rangle & 3|k \\
\langle 1, y, y^2, y^3, z \rangle & 5|k \\
\langle 1 \rangle & \text{otherwise.} 
\end{cases} \]
<table>
<thead>
<tr>
<th>$k$</th>

<td>$e_{13}$</td>
<td>$e_{14}$</td>
</tr>
</tbody>
</table>

Table 13: $Q_{12}$ A side elements.

Potential non-zero correlators:

Concavity axiom:
\[ \langle e_1, e_1, e_{14} \rangle, \langle e_1, e_8, e_7 \rangle, \langle e_1, e_{11}, e_4 \rangle, \langle e_1, e_{13}, e_2 \rangle \langle e_{13}, e_{11}, e_7 \rangle \text{ all equal } 1 \]

Pairing axiom:
\[ \langle e_1, y^2 e_{10}, y^2 e_5 \rangle = \frac{1}{10} \]
\[ \langle e_1, z e_{10}, z e_5 \rangle = -\frac{1}{2} \]

Correlator equation:
\[ -2 = -2\langle e_{13}, e_{13}, z e_5 \rangle \langle e_{13}, z e_{10}, e_8 \rangle + 10\langle e_{13}, e_{13}, y^2 e_5 \rangle \langle e_{13}, y^2 e_{10}, e_8 \rangle \]

Correlators we cannot determine with axioms alone:
\[ \langle e_{13}, e_{13}, z e_5 \rangle = a_1 \]
\[ \langle e_{13}, z e_{10}, e_8 \rangle = a_2 \]
\[ \langle e_{13}, e_{13}, y^2 e_5 \rangle = a_3 \]
\[ \langle e_{13}, y^2 e_{10}, e_8 \rangle = a_4 \]
\[ \langle e_{11}, y^2 e_{10}, y^2 e_{10} \rangle = a_5 \]
\[ \langle e_{11}, z e_{10}, y^2 e_{10} \rangle = a_6 \]
\[ \langle e_{11}, z e_{10}, z e_{10} \rangle = a_7 \]

Table 16: $Q_{12}$ B side multiplication
System of equations found by matching the multiplication tables:

\[
\begin{align*}
    a_1 &= -2b = \frac{g}{2(eh - gf)} \\
    a_2 &= -2f = \frac{c}{2(ad - cb)} \\
    a_3 &= -2d = \frac{e}{10(gh - gf)} \\
    a_4 &= -2h = \frac{a}{10(ad - cb)} \\
    a_5 &= 30g^2 - 2h^2 = \frac{ah - gb}{10(ad - cb)} \\
    a_6 &= 30eg - 2fh = \frac{af - eb}{10(ad - cb)} = \frac{dg - hc}{-2(ad - cb)} \\
    a_7 &= 30e^2 - 2f^2 = \frac{de - fc}{-2(ad - cb)} \\
\end{align*}
\]

\[
\begin{align*}
    30ae - 2fb &= -\frac{1}{2} \\
    30ce - 2df &= 0 \\
    30ag - 2bf &= 0 \\
    30cg - 2dh &= \frac{1}{10}
\end{align*}
\]

Solution to these equations in terms of the \( a_i \)s:

\[
\begin{align*}
    a &= \frac{a_4a_1}{2\sqrt{30a_5 + 15a_4^2}} \\
    b &= -\frac{a_1}{2} \\
    c &= \frac{a_2a_1}{10\sqrt{30a_5 + 15a_4^2}} \\
    d &= -\frac{a_3}{2} \\
    e &= \frac{a_3\sqrt{30a_5 + 15a_4^2}}{6a_1} \\
    f &= -\frac{a_2}{2}
\end{align*}
\]
\[ g = \frac{1}{30} \sqrt{30a_5 + 15a_4^2} \]
\[ h = \frac{a_4}{2} \]

With the relations:

\[ a_3 = \frac{a_1a_2 - 1}{5a_4} \]
\[ a_6 = \frac{2a_1a_2a_5 - 2a_5 - a_4^2}{2a_1a_4} \]
\[ a_7 = \frac{2a_2^2a_1^3a_5 - 4a_1a_2a_5 - 2a_2a_1^2a_1 + 2a_5 + a_4^2}{2a_4a_1^2} \]

### 3.1.4 \( U_{12} \)

**A model:** \( U_{12} : x^3 + y^3 + z^4 \)

\[ J = \langle 3x^2, 3y^2, 4z^3 \rangle \]

\[ q_x = \frac{1}{3}, q_y = \frac{1}{3}, q_z = \frac{1}{4} \]

\[ G_{U_{12}} = \langle (\alpha, \beta, \gamma) \rangle \cong \mathbb{Z}_3 \times \mathbb{Z}_3 \times \mathbb{Z}_4 \] when \( \alpha^3 = \beta^3 = \gamma^4 = 1 \)

\[ \text{Fix} J^k = \begin{cases} 
\mathbb{C}^3 & k = 0 \\
\mathbb{C}^2_{xy} & 3|k \\
\mathbb{C}_z & 4|k \\
0 & \text{else.} 
\end{cases} \]

\[ Q|_{\text{Fix} J^k} = \begin{cases} 
\langle 1, x, y, z, z^2, xy, xz, xz^2, yz, yz^2, xyz, xyz^2 \rangle & k = 0 \\
\langle 1, x, y \rangle & 3|k \\
\langle 1, z, z^2 \rangle & 4|k \\
\langle 1 \rangle & \text{else.} 
\end{cases} \]

Table 20: \(U_{12}\) B side multiplication.
System of equations found by matching the multiplication tables:

\begin{align*}
    a_1 &= \frac{hc - gd}{9(he - gf)} = \frac{gl - kh}{9(il - jk)} = 12(ch + dg) \\
    a_2 &= \frac{ed - cf}{9(he - gf)} = \frac{el - kf}{9(il - jk)} = 12(cf + de) \\
    a_3 &= \frac{ha - gb}{9(he - gf)} = \frac{ih - jg}{9(il - jk)} = 12(ah + bg) \\
    a_4 &= \frac{eb - af}{9(he - gf)} = \frac{if - je}{9(il - jk)} = 12(af + be) \\
    a_5 &= 24cd = \frac{cl - kd}{9(il - jk)} \\
    a_6 &= 12(ad + bc) = \frac{al - kb}{9(il - jk)} = \frac{id - jc}{9(il - jk)} \\
    a_7 &= 24ab = \frac{ib - ja}{9(il - jk)} \\

    12(a_j + b_i) &= 0 \\
    12(al + bk) &= \frac{1}{9} \\
    12(cj + di) &= \frac{1}{9} \\
    12(cl + dk) &= 0 \\
    24ef &= 0 \\
    24gh &= 0 \\
    12(eh + fg) &= \frac{1}{9}
\end{align*}

Solution to this system in terms of the $a_i$s:

\begin{align*}
    a &= \frac{a_3}{12h} \\
    b &= 9ha_4 \\
    c &= \frac{a_1}{12h} \\
    d &= 9ha_2
\end{align*}
\[ e = \frac{1}{108h} \]
\[ f = 0 \]
\[ g = 0 \]
\[ h = h \]
\[ i = \frac{a_1}{972h(a_1a_4 - a_3a_2)} \]
\[ j = \frac{ha_4}{9(a_1a_4 - a_3a_2)} \]
\[ k = \frac{a_1}{972h(a_1a_4 - a_3a_2)} \]
\[ l = -\frac{ha_2}{9(a_1a_4 - a_3a_2)} \]

With the relations:

\[ a_5 = 18a_2a_1 \]
\[ a_6 = 9a_4a_1 + 9a_3a_2 \]
\[ a_7 = 18a_3a_4 \]

### 3.2 Bimodal Singularities

#### 3.2.1 \(Z_{1,0}\)

**A model:** \( Z_{1,0} : yx^3 + y^7 \)

\[ J = \langle 3x^2y, x^3 + 7y^6 \rangle \]

\[ q_x = \frac{2}{7}, q_y = \frac{1}{7} \]

\[ G_{Z_{1,0}} = \langle (\alpha, \alpha^{-3}) \rangle \cong \mathbb{Z}_{21} \text{ when } \alpha^{21} = 1 \]
\[
\text{Fix}\, J^k = \begin{cases}
\mathbb{C}^2 & k = 0 \\
0 & \text{otherwise.}
\end{cases}
\]

\[
\mathcal{Q}_{\text{Fix}, J^k} = \begin{cases}
\langle 1, x, x^2, y, y^2, y^3, y^4, y^5, y^6, xy, xy^2, xy^3, xy^4, xy^5, xy^6 \rangle & k = 0 \\
\langle 1 \rangle & \text{otherwise.}
\end{cases}
\]

x^2y^2b_0 & b_0 & xyb_0 & \alpha & -\frac{1}{3}x^2y^5b_0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
x^2y^5b_0 & b_0 & xyb_0 & \alpha & -\frac{1}{3}x^2y^5b_0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
\hline
\end{array}
\]

Table 24: $Z_{1,0}$ B side multiplication.
System of equations found by matching the multiplication tables and correlator equations:

\[
\begin{align*}
399ab - 3c^2 & = -\frac{1}{3} \\
\frac{399}{2} (ae + bd) - 3cf & = 0 \\
\frac{399}{2} (ah + bg) - 3ci & = 0 \\
399de - 3f^2 & = 0 \\
\frac{399}{2} (dh + eg) - 3fi & = \frac{1}{21} \\
399gh - 3i^2 & = 0 \\
-3 & = -27c^2 + 378fi \\
a_1 & = -3c = \frac{-eg + hd}{-3(-ceg + chd - fah + fbg + iae - ibd)} \\
a_2 & = -3i = \frac{ah - bg}{21(-ceg + chd - fah + fbg + iae - ibd)} \\
a_3 & = -3f = \frac{ae - bd}{21(-ceg + chd - fah + fbg + iae - ibd)}
\end{align*}
\]

Solution in terms of the \(a_i\)s:

\[
\begin{align*}
a & = \frac{a_1a_2 - a_2}{1197h} \\
b & = \frac{a_1h + h}{a_2} \\
c & = -\frac{a_1}{3} \\
d & = \frac{(a_1 - 1)^2}{16758h} \\
e & = \frac{h(a_1 + 1)^2}{14a_2^2} \\
f & = -\frac{a_3}{3} \\
g & = \frac{a_2^2}{1197h}
\end{align*}
\]
\[ h = h \]
\[ i = -\frac{a_2}{3} \]

With the relation:
\[ a_3 = \frac{a_1^2 - 1}{14a_2} \]

### 3.2.2 $Q_{2,0}$

**A model:** $Q_{2,0} : x^3 + xy^4 + yz^2$

\[
\mathcal{J} = \langle 3x^2 + y^4, 4xy^3 + z^2, 2yz \rangle
\]

\[
q_x = \frac{1}{3}, q_y = \frac{1}{6}, q_z = \frac{5}{12}
\]

\[ G_{Q_{2,0}} = \langle (\gamma^8, \gamma^{-2}, \gamma) \rangle \cong \mathbb{Z}_{24} \text{ when } \gamma^{24} = 1 \]

\[
\text{Fix } J^k = \left\{ \begin{array}{ccc}
\mathbb{C}^3 & k = 0 \\
\mathbb{C}_{xy}^2 & k = 6 \\
\mathbb{C}_x & k = 3, 9 \\
0 & \text{otherwise.} 
\end{array} \right.
\]

\[
Q|_{\text{Fix } J^k} = \left\{ \begin{array}{ccc}
\langle 1, x, x^2, y, y^2, y^3, z, x, z^2, x, xy, xy^2, x^2y, x^2y^2, xz, xz^2 \rangle & k = 0 \\
\langle 1, x, x^2, y, y^2, x, xy, xy^2, x^2y, x^2y^2 \rangle & k = 6 \\
\langle 1, x \rangle & k = 3, 9 \\
\langle 1 \rangle & \text{otherwise.} 
\end{array} \right.
\]
Non-zero correlators:

Concavity axiom:

\[ \langle e_1, e_1, e_{11} \rangle, \langle e_1, e_7, e_5 \rangle, \langle e_1, e_8, e_4 \rangle, \langle e_1, e_{10}, e_2 \rangle, \langle e_{10}, e_8, e_7 \rangle, \langle e, e, e \rangle \text{ all equal } 1. \]

Pairing axiom:

\[ \langle e_1, y^3e_6, y^3e_6 \rangle = -\frac{1}{4} \]

\[ \langle e_1, xye_6, xye_6 \rangle = \frac{1}{12} \]

Index zero axiom:

\[ \langle e_{10}, e_{10}, e_5 \rangle = -2 \]

Table 32: $S_{1,9}$ B side multiplication.
System of equations found by matching the multiplication tables:

\[
\begin{align*}
  a_1 &= -2b = \frac{c}{2(ad - bc)} \\
  a_2 &= -2d = \frac{a}{10(ad - bc)} \\
  \frac{170}{3}a^2 - 2b^2 &= \frac{1}{2} \\
  \frac{170}{3}ac - 2bd &= 0 \\
  \frac{170}{3}c^2 - 2d^2 &= \frac{1}{10} \\
  -2 &= -8b^2 + 40d^2
\end{align*}
\]

Solution in terms of the \(a\)\(_i\)s:

\[
\begin{align*}
  a &= -\frac{1}{34}a_2\sqrt{51} \\
  b &= -\frac{a_1}{2} \\
  c &= -\frac{\sqrt{51}a_1}{170} \\
  d &= -\frac{a_2}{2}
\end{align*}
\]

With the relation:

\[
a_1 = -\sqrt{1 + 5a_2^2}
\]

3.2.4 \(U_{16}\)

A model: \(U_{16} : x^3 + z^2x + y^5\)

\[
\mathcal{J} = \langle 3x^2 + z^2, 5y^4, 2zx \rangle
\]

\[

Table 36: $U_{16}$ B side multiplication.
System of equations found by matching the multiplication tables:

\[
\begin{align*}
a_1 &= -\frac{ed + cf}{6(\text{eh} - \text{fg})} = -\frac{-ml + kn}{6(-\text{on} + \text{pm})} = 10ck - 2dl \\
a_2 &= -\frac{dg + hc}{-2(\text{eh} - \text{fg})} = -\frac{-mj + in}{6(-\text{on} + \text{pm})} = ci - 2dj \\
a_3 &= -\frac{-ih + jg}{6(\text{il} - \text{jk})} = 30g^2 - 2h^2 \\
a_4 &= -\frac{-if + je}{6(\text{il} - \text{jk})} = -\frac{-kh + gl}{-2(\text{il} - \text{jk})} = 10eg - 2fh \\
a_5 &= -\frac{-eb + af}{6(\text{eh} - \text{fg})} = -\frac{-ol + pk}{-2(-\text{on} + \text{pm})} = 10ak - 2bl \\
a_6 &= -\frac{-bg + ha}{-2(\text{eh} - \text{fg})} = -\frac{-oj + pi}{-2(-\text{on} + \text{pm})} = 10ai - 2bj \\
a_7 &= -\frac{-kf + el}{-2(\text{il} - \text{jk})} = 10e^2 - 2f^2 \\
a_8 &= -\frac{-id + jc}{6(\text{il} - \text{jk})} = 10cg - 2dh = -\frac{-mh + gn}{6(-\text{on} + \text{pm})} \\
a_9 &= -\frac{-kd + cl}{-2(\text{il} - \text{jk})} = 10ce - 2df = -\frac{-mf + en}{6(-\text{on} + \text{pm})} \\
a_{10} &= 10c^2 - 2d^2 = -\frac{-md + cn}{6(-\text{on} + \text{pm})} \\
a_{11} &= 10ac - 2bd = -\frac{-mb + an}{6(-\text{on} + \text{pm})} = -\frac{-od + pc}{-2(-\text{on} + \text{pm})} \\
a_{12} &= -\frac{-ib + ja}{6(\text{il} - \text{jk})} = 10ag - 2bh = -\frac{-oh + pg}{-2(-\text{on} + \text{pm})} \\
a_{13} &= -\frac{-kb + al}{-2(\text{il} - \text{jk})} = 10ae - 2bf = -\frac{-of + pe}{-2(-\text{on} + \text{pm})} \\
a_{14} &= 10a^2 - 2b^2 = -\frac{-ob + pa}{-2(-\text{on} + \text{pm})} \\
10am - 2bn &= -\frac{1}{2} \\
10ao - 2bp &= 0 \\
10cm - 2dn &= 0 \\
10co - 2dp &= \frac{1}{6}
\end{align*}
\]
\[10ei - 2fj = -\frac{1}{2}\]
\[10gi - 2hj = 0\]
\[10ek - 2fl = 0\]
\[10gk - 2hl = \frac{1}{6}\]

Solution to this system of equations in terms of the \(a_i\)s:

\[a = \frac{a_5\sqrt{2}(-5a_1a_7 + 5a_9)}{10a_1\sqrt{-a_7}}\]
\[b = \frac{a_13\sqrt{2}}{2\sqrt{-a_7}}\]
\[c = \frac{\sqrt{2}(-5a_1a_7 + 5a_9)}{10\sqrt{-a_7}}\]
\[d = \frac{a_9\sqrt{2}}{1\sqrt{-a_7}}\]
\[e = 0\]
\[f = -\frac{1}{2} \sqrt{-2a_7}\]
\[g = \frac{\sqrt{2}(-5a_1a_7 + 5a_9)}{60a_1\sqrt{-a_7}}\]
\[h = \frac{a_4\sqrt{2}}{2\sqrt{-a_7}}\]
\[i = -\frac{3a_1a_4\sqrt{2}}{2\sqrt{-a_7}(-5a_1a_7 + 5a_9)}\]
\[j = -\frac{\sqrt{2}}{4\sqrt{-a_7}}\]
\[k = \frac{a_1\sqrt{-2a_7}}{2\sqrt{-5a_1a_7 + 5a_9}}\]
$l = 0$

$m = \frac{a_1 a_9 \sqrt{-2a_7}}{4 \sqrt{-5a_1 0a_7 + 5a_9^2 (-a_9 a_7 + a_1 a_3)}}$

$n = \frac{a_1 \sqrt{-2a_7}}{4(-a_9 a_7 + a_1 a_3)}$

$o = \frac{a_1 a_{13} \sqrt{-2a_7}}{12 \sqrt{-5a_1 0a_7 + 5a_9^2 (-a_9 a_7 + a_1 a_3)}}$

$p = \frac{a_5 \sqrt{-2a_7}}{12(-a_9 a_7 + a_1 a_3)}$

With the relations:

\[
\begin{align*}
  a_2 &= \frac{-a_9 + 6a_4 a_1}{2a_7} \\
  a_3 &= \frac{36a_4^2 a_1^2 + a_1 0a_7 - a_9^2}{36(a_7 a_1^2)} \\
  a_6 &= \frac{-a_1 a_3 + 6a_4 a_5}{2a_7} \\
  a_8 &= \frac{6a_4 a_1 a_9 + a_1 0a_7 - a_9^2}{6(a_7 a_1)}
\end{align*}
\]

3.2.5 $Q_{16}$

A model: $Q_{16}: x^3 + yz^2 + y^7$

$\mathcal{J} = \langle 3x^2, z^2 + 7y^6, 2yz \rangle$

$q_x = \frac{1}{3}, q_y = \frac{1}{7}, q_z = \frac{3}{7}$

$G_{Q_{16}} = \langle (\alpha, \gamma^{-2}, \gamma) \rangle \cong \mathbb{Z}_{42}$ when $\alpha^3 = \gamma^{14}$
\[
\text{Fix} J^k = \begin{cases}
C^3 & k = 0 \\
C^2_u & 7|k \\
C_x & 3|k \\
0 & \text{else}.
\end{cases}
\]

\[
Q|_{\text{Fix} J^k} = \begin{cases}
\langle 1, x, y^2, y^3, y^4, y^5, y^6, z, xy, xy^2, xy^3, xy^4, xy^5, xy^6, xz \rangle & k = 0 \\
\langle 1, y, y^2, y^3, y^4, y^5, y^6, z \rangle & 7|k \\
\langle 1, x \rangle & 3|k \\
\langle 1 \rangle & \text{else}.
\end{cases}
\]

Table 39: $Q_{16}$ B side elements.

For Table 40 we will let

$$
\alpha = ab_1 + bz^6b_0 \\
\beta = cb_1 + dz^6b_0 \\
\gamma = exb_1 + fzx^6b_0 \\
\eta = gb_1 + hzx^6b_0
$$
Table 40: $Q_{16}$ B side multiplication.
System of equations found by matching the multiplication tables:

\[
\begin{align*}
  a_1 &= -2f = \frac{c}{2(ad - bc)} \\
  a_2 &= -2b = \frac{g}{2(he - gf)} \\
  a_3 &= -2h = \frac{a}{14(ad - bc)} \\
  a_4 &= -2d = \frac{e}{14(he - gf)} \\
  a_5 &= -2b = \frac{g}{2(he - gf)} \\
  a_6 &= -2d = \frac{e}{14(he - gf)} \\
  a_7 &= \frac{ed - cf}{14(he - gf)} = \frac{182}{3}c^2 - 2d^2 \\
  a_8 &= \frac{eb - af}{14(he - gf)} = \frac{hc - gd}{-2(he - gf)} = \frac{182}{3}ac - 2bd \\
  a_9 &= \frac{ha - gb}{-2(he - gf)} = \frac{182}{3}a^2 - 2b^2 \\
  \frac{182}{3}ae - 2bf &= \frac{1}{2} \\
  \frac{182}{3}ag - 2bh &= 0 \\
  \frac{182}{3}ce - 2df &= 0 \\
  \frac{182}{3}cg - 2dh &= \frac{1}{14} \\
  -2 &= -8fb + 56hd
\end{align*}
\]

Solution of the system of equations in terms of the \(a_i\)s:

\[
\begin{align*}
  a &= \frac{1}{182}\sqrt{546a_9 + 273a_2^2} \\
  b &= \frac{-a_2}{2} \\
  c &= \frac{3a_1\sqrt{2a_9 + a_2^2}}{14a_3\sqrt{273}} \\
  d &= \frac{-a_4}{2}
\end{align*}
\]
\[ e = \frac{21a_3a_4}{2\sqrt{546a_9 + 273a_2^2}} \]
\[ f = -\frac{a_1}{2} \]
\[ g = \frac{3a_3a_2}{2\sqrt{546a_9 + 273a_2^2}} \]
\[ h = -\frac{a_3}{2} \]

With the relations:

\[ a_1 = \frac{7a_3a_4 + 1}{a_2} \]
\[ a_7 = \frac{a_1a_4a_9 + a_2a_4 + a_8}{7a_2a_3} \]
\[ a_8 = \frac{2a_1a_9 + a_2}{14a_3} \]
